

Tabelle 6. Winkel innerhalb einer Jodatgruppe

Atom 1	Atom 2	Atom 3	Winkel(°)	Fehler(°)
O(1)	O(2)	O(3)	63,0	0,3
O(2)	O(1)	O(3)	59,5	0,3
O(1)	O(3)	O(2)	57,5	0,3
O(1)	J	O(2)	92,8	0,4
O(1)	J	O(3)	102,2	0,3
O(2)	J	O(3)	95,3	0,4

Die Packungsdichte im $K_2Ge(I\!O_3)_6$ ist typisch für Jodatstrukturen. Die Raumerfüllung beträgt ca. 51% gegenüber 74% in einer dichtesten Sauerstoffpackung.

Die für die Steuerung und Auswertung der Diffraktometermessungen notwendigen Programme stellte uns dankenswerterweise Herr Professor Dr G. Ruban zur Verfügung. Die übrigen Rechnungen wurden mit Programmen des Systems X-ray 63 (*X-ray Handbook*, 1965) am DRZ in Darmstadt durchgeführt.

Herrn Professor Dr K. Plieth danken wir sehr herzlich dafür, dass er uns Messzeit am Vierkreisdiffraktometer des Instituts für Kristallographie (FU Berlin) ein-

geräumt hat, den Herrn Dr W. Dreissig und Dr P. Luger schulden wir Dank für ihre Unterstützung bei der Durchführung der Messungen und Rechnungen.

Dem Verband der Chemischen Industrie danken wir für die finanzielle Förderung der Untersuchungen.

The Crystal Structure of a Seco Steroid

BY C. S. YOO, J. PLETCHER AND M. SAX

The Department of Crystallography, University of Pittsburgh, Pittsburgh, Pa. 15213, U.S.A.

and

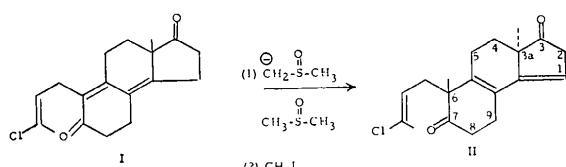

The Biocrystallography Laboratory, Veterans Administration Hospital, Pittsburgh, Pa. 15240, U.S.A.

(Received 28 October 1971 and in revised form 8 May 1972)

The crystal and molecular structure of *d,l*-3a,6-dimethyl-6-(*trans*-3-chlorobut-2-ene-1-yl)-2,4,5,6,8,9-hexahydro-3*H*-benz[e]indene-3,7-(3a*H*)-dione ($C_{19}H_{23}O_2Cl$), II, has been determined from X-ray diffraction data in order to establish the geometrical isomerism of the molecule. The space group is monoclinic, $P2_1/c$, with four molecules in a unit cell of dimensions: $a = 10.091$ (3), $b = 11.515$ (3), $c = 14.709$ (4) Å, $\beta = 92.54$ (4)°. The intensities of 2912 reflections were measured on a four-circle automated diffractometer using Cu $K\alpha$ radiation. The structure was refined by the anisotropic least-squares method to a final *R* value on *F* of 0.081 computed with all of the structure factor data. The results of the crystal structure analysis show that two methyl groups are in the *trans* configuration. The conjugated double bond in the fused ring system confers an approximately coplanar arrangement on nine of the thirteen atoms in the rings.

Introduction

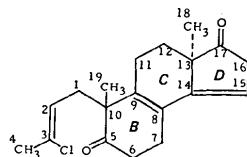

Compound II was prepared *via* base-induced methylation of dione I (Danishefsky *et al.*, 1972).

The relative stereochemical arrangement of the methyl groups at carbons (3a) and (6) was crucial to the possibility of subsequent use of II in the elaboration of steroids. The crystal structure of II was examined in order to determine whether these methyl groups are *cis* or *trans* with respect to the plane of the fused rings. This, in turn, had further significance with respect to the problem of the stereochemistry of methylation of extended enolates derived from diones such as I. Another reason for examining the three-dimensional structure of II was the possibility of assessing the con-

formational effects of the 8,14-diene systems on the steroid system (for convenience in comparing this structure with other steroids, the conventional steroid numbering scheme in Table 1 will be adopted in the subsequent discussion).

Table 1. Crystal data for seco steroid, $C_{19}H_{23}O_2Cl$

$C_{19}H_{23}O_2Cl$ M.W. = 318.847 m.p. = 132.5–133.5°C
Monoclinic, space group $P2_1/c$ from systematic absences: $h0l$ absent for l odd; $0k0$ absent for k odd.

$a = 10.091 (3)$ Å	$\lambda(Cu K\alpha) = 1.5418$ Å
$b = 11.515 (3)$	$\lambda(Cu K\alpha_1) = 1.54051$
$c = 14.709 (4)$	$\lambda(Cu K\alpha_2) = 1.5443$
$\beta = 92.54 (4)^\circ$	$\mu(Cu K\alpha) = 20.17$ cm $^{-1}$
$V = 1707.5$ Å 3	$F(000) = 680$
$Z = 4$	
$d_x = 1.240$ g.cm $^{-3}$	
$d_m = 1.237$ g.cm $^{-3}$	measured by flotation method in aqueous potassium iodide solution at 23°C

Experimental

The crystals of II, which were supplied by Professor S. Danishefsky and Dr P. Solomon, are colorless, acicular in habit, and elongated in the direction of the unique axis. The space group was determined from oscillation and Weissenberg photographs. The unit-cell dimensions were deduced from manual 2θ scans of the observable axial reflections using a Picker automatic diffractometer equipped with a scintillation counter. The crystal was mounted such that its b axis coincided with the φ axis of the full-circle crystal orienter. Ni-filtered Cu $K\alpha$ radiation was used throughout the analysis. Table 1 contains the crystal data.

The integrated intensity measurements were made by scanning reflections in the $\theta:2\theta$ mode at a rate of 2°/min over a 2θ range of 2°. At both limits of this range, stationary 10 sec background counts were taken. Seven reflections were chosen as standards, and at least a pair of these were monitored at intervals of approximately two hours. Examination of the standards during the data collection revealed a gradual decrease of 7% in the diffraction intensity. Scale factors based on the seven standards compensate to a large extent for the time-dependent decrease.

In total, 2912 reflections were collected; of these 728 were less than $3 \sigma(I)$, where $\sigma(I)$ is given by

$$ATN[(10S+5)+9\{(10B_1+5)+(10B_2+5)\}]^{1/2},$$

S is the total number of decacounts accumulated during the scan, and ATN is the attenuator factor. B_1 and B_2 are the accumulated background in decacounts. The intensities were corrected in the usual manner by the Lorentz and polarization factors, but they were not corrected for absorption.

Structure determination and refinement

An initial set of structure amplitudes ($|F_o|$) were calculated from the 2912 independent reflections. The X-ray 70 system of programs (Stewart, Kundell & Baldwin, 1970) was used to compute both a scale and an overall temperature factor from a Wilson (1942) plot, to convert the observed structure factor amplitudes to normal E values, and to determine the signs of 332 reflections, $E \geq 1.50$, by the direct method (programs SIGMA 2 and PHASE). The coordinates of 17 atoms were obtained readily from an E map computed with the 332 normalized structure factors. The remaining 5 atoms, exclusive of the hydrogens, were located in a difference Fourier synthesis which followed a single cycle of isotropic full-matrix least-squares refinement of the partial structure. The parameters of the 22 atoms were then refined anisotropically by the full-matrix least-squares method. The Hughes (1941) weighting scheme was employed with $\sigma = F/11.3$ if $F > 11.3$ and with $\sigma = 1$ if $F \leq 11.3$. The function minimized was $\sum w(|F_o| - K|F_c|)^2$ where K is a single scale factor. Atomic scattering factors for chlorine, oxygen, and carbon were taken from the International Tables for X-ray Crystallography (1962), while those for hydrogen were taken from Stewart, Davidson & Simpson (1965). The hydrogen coordinates were obtained from a difference synthesis calculated when the R value had been reduced to 0.12 for all reflections. These were included as variables in subsequent cycles of refinement. However, hydrogen thermal parameters were not refined but were set equal to those of the atoms to which the hydrogens are bonded. The final reliability index was 0.081 for all 2912 independent reflections and 0.064 for the 2184 observed reflections. The structure amplitudes of all reflections are listed in Table 2. The atomic coordinates and thermal parameters with their e.s.d.'s are given in Table 3.

Other computer programs used in this analysis are the Shiono (1965) version of ORFLS (Busing, Martin & Levy, 1962), a modification of the Zalkin Fourier Synthesis (Shiono, 1967), the ORTEP program (Johnson, 1965), and a number of those listed in the University of Pittsburgh Crystallography Laboratory Technical Reports (Shiono, 1963–1968).

Discussion of the structure

The molecular shape and the thermal ellipsoids of the atoms are depicted in Fig. 1. The least-squares planes through some regions of the B , C and D rings and the distances of various atoms from these planes are given in Table 4. Planes 1 and 2 show that the conventional chair or boat description does not apply to the six-membered rings, B and C , because of the presence of unsaturation at C(8)–C(9). Ring D has a distorted envelope conformation as indicated by plane 3 and by torsion angle C(13)–C(14)–C(15)–C(16) which is 4.2°. As expected for a conjugated diene system, atoms C(7), C(8), C(9), C(10), C(11), C(13), C(14)

THE CRYSTAL STRUCTURE OF A SECO STEROID

Table 2. Observed and calculated structure factors

The columns within each group in order from left to right are the running index l , $10|F_O|$ and $10|F_C|$. Asterisks indicate unobserved reflections.

site side. Accordingly, methyl groups $\text{CH}_3(18)$ and $\text{CH}_3(19)$ are in the *trans* configuration. The keto oxygen atom, O(1), lies -0.390 \AA out of plane 1 while the other keto oxygen, O(2), lies 0.886 \AA out of plane 3. The torsion angles around the C(1)–C(10) bond connecting the side chain are:

$\text{C}(2)\text{--C}(1)\text{--C}(10)\text{--C}(19) = -179.7^\circ$; $\text{C}(2)\text{--C}(1)\text{--C}(10)\text{--C}(5) = -65.8^\circ$; and $\text{C}(2)\text{--C}(1)\text{--C}(10)\text{--C}(9) = 58.4^\circ$. The Cl atom is *cis* relative to C(1).

The bond distances and valency angles with their associated standard deviations, exclusive of those involving hydrogen atoms, are shown in Fig. 2. The C–H bond distances lie in the range between 0.75 and 1.06 \AA . The single bonds to C(10) are longer than expected, even though the experimental bond distances in Fig. 2 are probably underestimated because of the thermal motion of the molecule. Bonds C(9)–C(10) and C(5)–C(10) exceed 1.505 \AA , the normally quoted

Table 4. Some least-squares planes through groups of atoms

Coefficients $\times 10^4$ in $Ax + By + Cz - D = 0$, referred to the crystallographic axes (x, y, z in \AA).

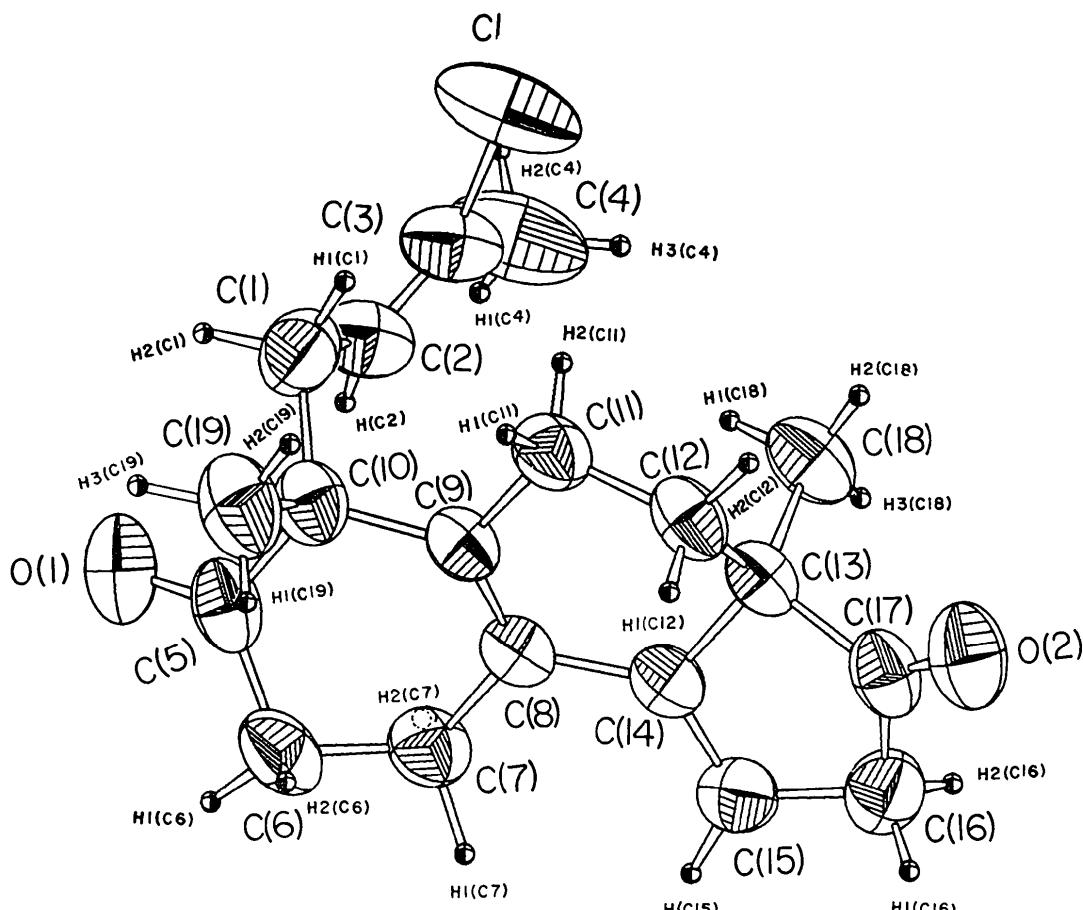

Fig. 1. A thermal ellipsoid plot (Johnson, 1965), at the 50% probability level, of one molecule showing the numbering system of the atoms.

distance for an sp^2-sp^3 single bond between carbon atoms (Bartell & Bonham, 1960) by 2.8 and 4.8σ respectively. Bonds C(1)-C(10) and C(19)-C(10) are 1.8

and 1.6σ greater than 1.54 Å, the sp^3-sp^3 distance. On the other hand, endocyclic bonds C(15)-C(16), C(16)-C(17), C(12)-C(13), C(11)-C(12), C(5)-C(6) and C(6)-

Table 5. Torsion angles in the rings and at the B/C and C/D junctions

ϕ in Part I is the torsion angle about the specified bond. The other two atoms required to define the angle are attached to the ends of the bond and are in the ring in question.

The sign convention for the torsion angle is that of Klyne & Prelog (1960). The torsion angles in the other enantiomorph are opposite in sign.

Part I

B ring	Φ	C ring	Φ	D ring	Φ
C(5)-C(6)	-55.4°	C(9)-C(11)	-19.6	C(13)-C(14)	-17.5
C(6)-C(7)	53.8	C(11)-C(12)	47.8	C(14)-C(15)	4.2
C(7)-C(8)	-25.3	C(12)-C(13)	-55.3	C(15)-C(16)	11.4
C(8)-C(9)	-5.7	C(13)-C(14)	37.4	C(16)-C(17)	-22.4
C(9)-C(10)	6.2	C(14)-C(8)	-8.9	C(17)-C(13)	24.3
C(10)-C(5)	25.5	C(8)-C(9)	-0.8		

Part II

B/C junction	Φ	C/D junction	Φ
C(7)-C(8)-C(9)-C(11)	177.1°	C(8)-C(14)-C(13)-C(17)	159.0
C(10)-C(9)-C(8)-C(14)	176.4	C(12)-C(13)-C(14)-C(15)	-139.2
C(6)-C(7)-C(8)-C(14)	152.7	C(8)-C(14)-C(15)-C(16)	-171.9
C(5)-C(10)-C(9)-C(11)	-176.5	C(12)-C(13)-C(17)-C(16)	142.2
C(7)-C(8)-C(14)-C(13)	173.1	C(11)-C(12)-C(13)-C(17)	-167.8
C(10)-C(9)-C(11)-C(12)	163.0		

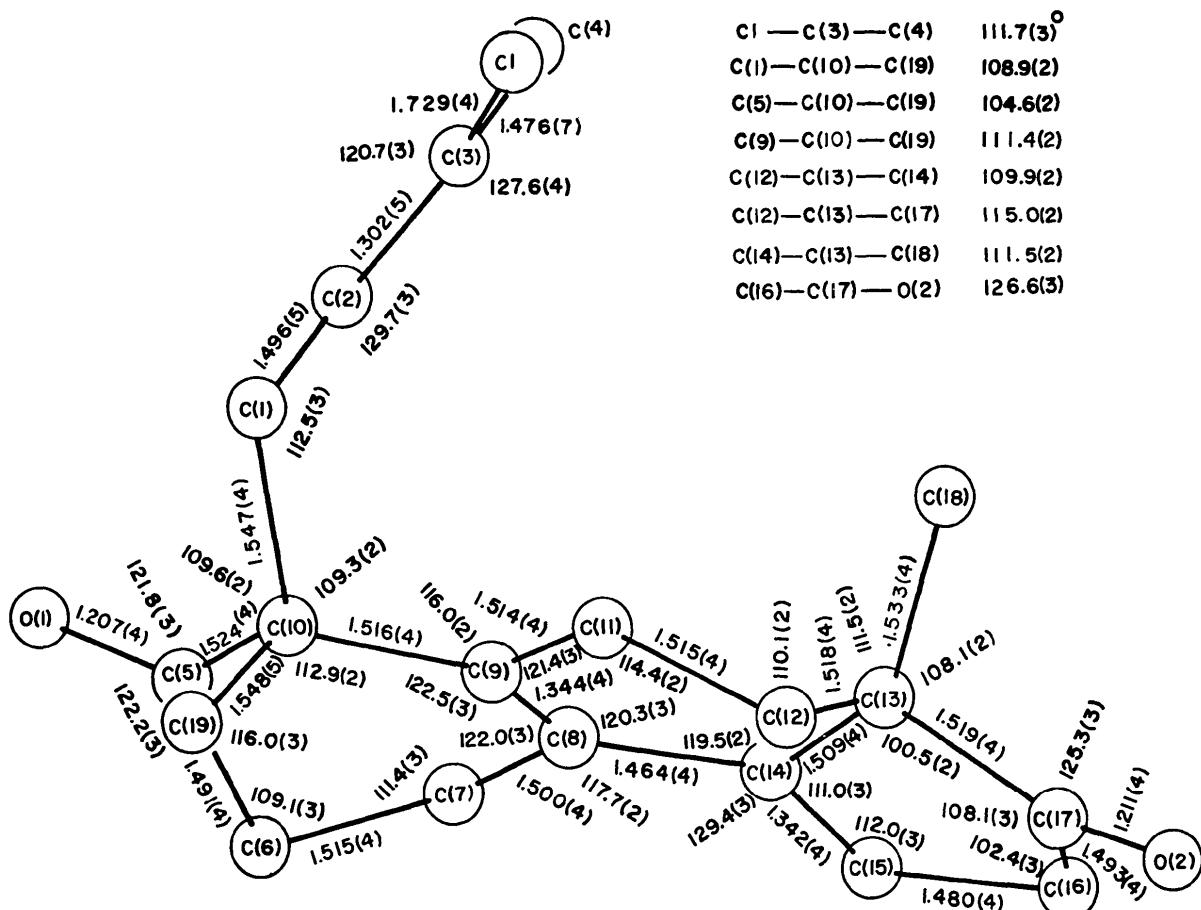

Fig. 2. Interatomic distances (\AA) and angles ($^\circ$) for the molecule. The estimated standard deviations are given in parentheses following the listed values.

C(7) are shorter by 6.3, 3.0, 5.5, 6.3, 3.5 and 6.3σ respectively, than their expectation values. Bonds C(2)–C(3) and C(3)–C(4) in the chlorobutanyl side chain are fore-shortened by 6.8 and 4.1σ , seemingly due to thermal disorder.

The projections of the structure along the *b* and *c* axes, illustrating the packing of the molecules, are shown in Figs. 3 and 4. The intermolecular contacts between nonhydrogen atoms which are less than 4 Å are listed in Table 6. The distances between neighboring molecules correspond to normal van der Waals interactions.

Table 6. Intermolecular distances less than 4 Å between nonhydrogen atoms

C(1)—C(6')	3.967 Å
C(11)—O(1')	3.964
C(12)—Cl"	3.987
C(19)—O(1')	3.441
C(19)—C(5')	3.950
C(19)—Cl"	3.971

Symmetry code:

$$' -x, \frac{1}{2}+y, \frac{1}{2}-z \\ '' x, \frac{1}{2}-y, \frac{1}{2}+z$$
