*Chemical Crystallography Laboratory, Imperial College, London SW7 2AY, England*

(Received 6 February 1974; accepted 23 February 1974)

4-Acetyl-2'-nitrobiphenyl,  $C_{14}H_{11}O_3N$ , is monoclinic, space group  $P2_1/c$ , with  $a=12.146$  (1),  $b=12.647$  (1),  $c=7.812$  (1) Å,  $\beta=94.33$  (1)°,  $Z=4$ ,  $D_m=1.29$ ,  $D_c=1.34$  g cm $^{-3}$ . The structure was solved by direct methods and refined by block-diagonal and full-matrix least-squares calculations to  $R=4.5\%$  for 1783 structure factors. The average ring C-C bond is 1.386 Å. The molecule is non-planar; there are rotations about the phenyl bond and C(10)-C(13) bond of +45.9 (2) and +12.7 (2)° respectively with additional small rotations. There is also distortion in the bond angles around C(2) and N.

### Experimental

Cell dimensions were obtained by least-squares refinement of 20 high-angle reflexions measured on a diffractometer with Cu  $K\alpha$  radiation. The observed density was measured by flotation in aqueous cadmium n-dodecatungstaborate.

#### Crystal data

$C_{14}H_{11}O_3N$ ,  $M=241.2$ . Monoclinic,  $a=12.146$  (1),  $b=12.647$  (1),  $c=7.812$  (1) Å,  $\beta=94.33$  (1)°,  $U=1196.6$  Å $^3$ ,  $D_m=1.29$  g cm $^{-3}$ ,  $D_c=1.34$  g cm $^{-3}$ ,  $Z=4$ ,  $F(000)=504$ ,  $\lambda(\text{Cu } K\alpha)=1.5418$  Å.

Absent spectra:  $0k0$  with  $k$  odd and  $h0l$  with  $l$  odd. Space group  $P2_1/c$ .

A suitable single crystal was mounted about the needle axis, corresponding to the  $c$  axis of the unit cell. Intensities of 1783 reflexions with  $\theta < 60$ ° of which 1622 were observed were collected on a Siemens single-crystal diffractometer AED with Cu  $K\alpha$  radiation (Skapski & Troughton, 1970).

The data were corrected for Lorentz and polarization effects; overall scale and temperature factors were obtained by Wilson's (1942) method, and a list of normalized structure factors, calculated without  $\epsilon$ , produced.

The structure was solved by direct methods from the 1121 relationships with probability >90% obtained for the 140 reflexions with  $E>1.75$ . An  $E$  map based on the 136 determined phases showed the positions of all the non-hydrogen atoms. After block-diagonal least-squares refinement to  $R=0.095$  where  $R=\sum||F_o|-|F_c||/\sum|F_o|$ , all hydrogen atoms were located from a difference synthesis. Full-matrix least-squares refinement of positional, scale and anisotropic thermal parameters for C, N and O and isotropic thermal

parameters for H resulted in a final  $R=0.045$ .\* Atomic scattering factors were obtained from Doyle & Turner (1968) except those for hydrogen which came from Stewart, Davidson & Simpson (1965).

Table 1 gives the heavy-atom coordinates and Table 2 their thermal parameters. The hydrogen-atom parameters are quoted in Table 3. The numbering of the atoms in the molecule and a stereo view of the structure are shown in Figs. 1 and 2 (Johnson, 1965).

All intermolecular contacts of less than 3.5 Å are shown in Table 4; the bond lengths and angles with

## Discussion

The average C–C bond in the two phenyl rings is  $1.386 \text{ \AA}$  with no bond differing from this by more than  $3\sigma$ . The angles C(1)–C(2)–C(3) and C(3)–C(2)–N,  $123.3$  and  $116.8^\circ$  respectively, are similar to the values  $123.7$  and  $117.1^\circ$  in *o*-nitrobenzoic acid (Tavale & Pant, 1973).

The C(2)–N bond,  $1.475(4) \text{ \AA}$ , is not significantly different from the values  $1.478(13) \text{ \AA}$  in *o*-nitrobenzoic acid,  $1.470(12)$  and  $1.482(12) \text{ \AA}$  in 1-(2',4'-dinitropenyl)-4-chloropyrazole (Galigné & Falgueirettes, 1970). The N–O bonds  $1.222(3)$  and  $1.219(3) \text{ \AA}$  are comparable with the values quoted for similar nitro-substituted compounds; tri-*p*-nitrophenyl phosphate (Mazhur-ul-Haque & Caughlan, 1970),  $1.22(1) \text{ \AA}$ ; *o*-nitrobenzoic acid,  $1.198(13)$  and  $1.221(13) \text{ \AA}$ . The angles C(2)–N–O(1), C(2)–N–O(2) and O(1)–N–O(2),  $117.3(3)$ ,  $118.8(2)$  and  $123.9(3)^\circ$  are not significantly different from the values in *o*-nitrobenzoic acid and 1-(2',4'-dinitropenyl)-4-chloropyrazole.

The distribution of bond angles around C(1) is similar to that for other 2'-halogen-substituted biphenyls with the angle C(2)–C(1)–C(6) considerably less than  $120^\circ$ .

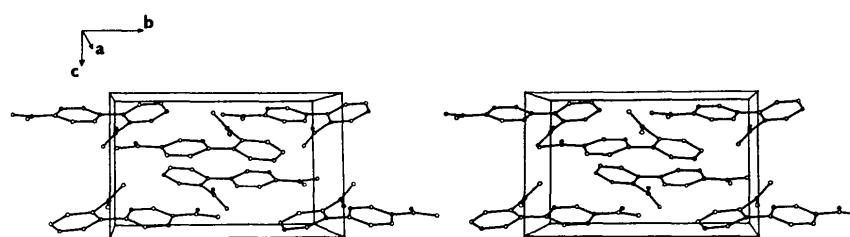

Fig. 2. A stereoscopic view of the molecular packing.

and C(7)–C(1)–C(2) greater than 120°. In the present structure the angle C(2)–C(1)–C(7) 125·2(3)° does not differ significantly from 125·4(15)° in 2'-iodobiphenyl-4-carboxylic acid (Sutherland, 1970) and 124·6(9)° in o-nitrobenzoic acid; the angle C(2)–C(1)–C(6) of

115·6(3)° is not significantly different from 117·9(16) and 118·7(9)° in 2'-iodobiphenyl-4-carboxylic acid and o-nitrobenzoic acid respectively. In several of the 2'-halogen-substituted biphenyls the halogen atom has been found to be displaced out of the plane C(1)–C(6); the nitrogen atom in the present structure is displaced by -0·083  $\text{\AA}$ , the C(2)–N bond being inclined at 3·2° to the biphenyl ring; C(7) is displaced from the ring C(1)–C(6) by 0·053  $\text{\AA}$ .

In common with the halogen-substituted biphenyls not only is there a rotation of one ring with respect to the other by an angle  $\varphi_1$  about C(1)–C(7) but also two other rotations,  $\varphi_2$  of the ring C(1)–C(6) about an axis which is in the plane of that ring and passes through C(1) perpendicular to C(1)–C(7) and  $\varphi_3$  of the ring C(7)–C(12) about an axis which is in the plane of that ring and passes through C(7) perpendicular to C(1)–C(7). In the present structure the angles  $\varphi_1$ ,  $\varphi_2$  and  $\varphi_3$  are respectively +45·9(2), +2·1(2) and -0·2(1)°.

The C(1)–C(7) length 1·485(4)  $\text{\AA}$  and the C(10)–C(13) length 1·494(4)  $\text{\AA}$  do not differ significantly from the theoretical value of 1·477  $\text{\AA}$  quoted by Cruickshank & Sparks (1960) for the length between trigonally hybridized carbon atoms.

The C(13)–O(3) and C(13)–C(14) bonds 1·216(4) and 1·498(5)  $\text{\AA}$  respectively compare favourably with 1·23 and 1·50  $\text{\AA}$ , the quoted values for C–O and C–CH<sub>3</sub> bonds, and do not differ significantly from the respective values of 1·211(9) and 1·495(13)  $\text{\AA}$  obtained for 4-acetyl-2'-fluorobiphenyl (Young, Tollin & Sutherland, 1968).

The acetyl group is rotated about the C(10)–C(13) bond through an angle  $\varphi_4$  of +12·7(2)°. Associated with this is a second rotation  $\varphi_5$  = +1·2(2)° of the group C(10), C(13), C(14) and O(3) about an axis which is in the plane of that group and passes through C(10) perpendicular to C(7)–C(10). The angle  $\varphi_4$  is significantly larger than that obtained in 2'-halogen-substituted biphenyls.

In the solid phase biphenyl is planar; the introduction of the nitro group in the 2' position results in intramolecular overcrowding. The strain is partly relieved by a twisting of the rings about the phenyl bond,  $\varphi_1$  with the additional small rotations  $\varphi_2$  and  $\varphi_3$ . There is in addition an increase in the C(7)–C(1)–C(2) bond angle; the nitrogen atom is displaced out of the plane of the phenyl ring away from the displacement of C(7); the nitro group is rotated about the C(2)–N bond away from the phenyl plane, with the N–H(12) distance 2·716  $\text{\AA}$  comparing well with the value of 2·70  $\text{\AA}$  obtained from the van der Waals radii. It is probable that there is a relayed steric effect which results in a small rotation and displacement of the acetyl group. The large value of  $\varphi_4$  is due partly to this and partly to intermolecular forces.

The authors thank Dr G.W. Gray for providing the crystals and Professor D. Rogers for the use of the Siemens diffractometer.

(Reçu le 19 décembre 1973, accepté le 18 février 1974)

The crystal structure of Na<sub>2</sub>PO<sub>3</sub>F β has been studied by X-ray diffraction. This compound is orthorhombic, space group *P*2<sub>1</sub>2<sub>1</sub>2<sub>1</sub>. The cell dimensions are *a*=5.416±0.003, *b*=6.929±0.004, *c*=19.079±0.010 Å and *Z*=8. Data were measured on an automatic diffractometer using Cu *Kα* radiation, *λ*=1.5418 Å. The structure was established by statistical methods and refined by least-squares analysis using anisotropic thermal parameters. The structure is characterized by two kinds of PO<sub>3</sub>F<sup>2-</sup> tetrahedron. The environments of oxygen and fluorine atoms are described. The final *R* index is 0.052 for 712 observed reflexions.

### Introduction

Dans le cadre d'une étude systématique de la stéréochimie de l'ion PO<sub>3</sub>F<sup>2-</sup> nous avons déjà publié la structure de LiKPO<sub>3</sub>F·H<sub>2</sub>O (Galigné, Durand & Cot, 1974). La présente étude concerne la structure détaillée de Na<sub>2</sub>PO<sub>3</sub>F β dans laquelle n'intervient aucune liaison hydrogène.

### Partie expérimentale

Le monofluorophosphate de sodium est préparé suivant la réaction:

Par cristallisation entre 20 et 40°C d'une solution aqueuse il se forme des monocristaux de monofluorophosphate de sodium anhydre que nous appelons Na<sub>2</sub>PO<sub>3</sub>F β (Durand, Granier & Cot, 1973).

Une étude au rétigraphe de Rimsky nous a permis de préciser le système cristallographique, le groupe d'espace et les paramètres de la maille. Ces derniers

sont affinés à partir des diagrammes de poudre. Les résultats sont les suivants:

$$\begin{array}{ll} a = 5,416 \pm 0,003 \text{ \AA} & \varrho_x = 2,676 \pm 0,005 \text{ g cm}^{-3} \\ b = 6,929 \pm 0,004 & \varrho_{\text{obs}} = 2,674 \pm 0,006 \text{ g cm}^{-3} \\ c = 19,079 \pm 0,010 & \\ V = 716,1 \pm 1,3 \text{ \AA}^3 & Z = 8 \end{array}$$

Système orthorhombique, groupe d'espace *P*2<sub>1</sub>2<sub>1</sub>2<sub>1</sub>. Axe d'allongement: *a*. La masse volumique  $\varrho_{\text{obs}}$  est mesurée par pycnométrie dans le benzène à 20,0±0,1°C

Un monocristal a été sélectionné puis transformé en sphère (*R*=0,35mm). Les mesures d'intensité ont été effectuées à la température ambiante sur diffractomètre automatique Enraf-Nonius type CAD 3. Un balayage  $\theta/2\theta$  est utilisé avec le rayonnement Cu *Kα* monochromatisé. 712 réflexions indépendantes ont été mesurées jusqu'à un angle  $\theta=68^\circ$ . La réflexion de référence 2T2 était repérée à intervalles réguliers de 50 réflexions et n'a pas montré de variations supérieures à 3%. Les intensités ont été corrigées des effets
