

The Ba ions, which lie on diad axes, are each surrounded by ten (*i.e.* five pairs of) O atoms. These are: O(4) (ketonic) at 2.73, O(6) (water) at 2.80, O(2) (ketonic) at 2.89, O(1) and O(3) (carboxylic) at 2.87 and 3.06 Å respectively.

Financial assistance from the National Research Council of Canada is gratefully acknowledged.

## Sodium Neodymium Metaphosphate NaNdP<sub>4</sub>O<sub>12</sub>

BY H. KOIZUMI

*Musashino Electrical Communication Laboratory, Nippon Telegraph and Telephone Public Corporation, Musashino-shi, Tokyo 180, Japan*

(Received 23 January 1976; accepted 12 March 1976)

**Abstract.** Monoclinic,  $P2_1/n$  ( $C_{2h}^5$ );  $a=9.907$  (4),  $b=13.10$  (1),  $c=7.201$  (3) Å,  $\beta=90.51$  (3)°;  $Z=4$ ,  $D_m=3.45$ ,  $D_c=3.43$  g cm<sup>-3</sup>;  $\mu(\text{Mo } K\alpha)=63.8$  cm<sup>-1</sup>. The structural framework consists of helical chains of  $(\text{PO}_3)_\infty$  along the  $c$  axis. Nd<sup>3+</sup> and Na<sup>+</sup> ions alternate linearly in a direction surrounded by four  $(\text{PO}_3)_\infty$  chains. NdO<sub>8</sub> dodecahedra and Na polyhedra form zigzag chains sharing faces. The refinement converged to  $R=0.028$ ,  $R_w=0.031$  for 2592 independent observed reflexions.

**Introduction.** Following the development of an efficient laser material LiNdP<sub>4</sub>O<sub>12</sub> (Yamada, Otsuka & Nakano, 1974), another new Nd phosphate crystal NaNdP<sub>4</sub>O<sub>12</sub> was found in our laboratory (Nakano, Otsuka & Yamada, 1976). The cell dimensions of the crystal are similar to those of the other alkaline Nd metaphosphate previously reported (Table 1).

Specimens were selected from crystals grown from

the melt of 33Na<sub>2</sub>O–7Nd<sub>2</sub>O<sub>3</sub>–60P<sub>2</sub>O<sub>5</sub> by the Kyropoulos technique (Nakano *et al.*, 1976). Precession and Weissenberg photographs exhibited  $2/m$  Laue symmetry with the following systematic absences:  $h0l$  when  $h+l=2n+1$ ,  $0k0$  when  $k=2n+1$ .

A prismatic crystal  $0.15 \times 0.20 \times 0.65$  mm was mounted with its  $c$  axis along the  $\varphi$  axis of the Rigaku Denki automatic four-circle X-ray diffractometer. Reflexions within  $(\sin \theta/\lambda)=0.72$  Å<sup>-1</sup> were measured using the  $\omega-2\theta$  scan technique with a Ge monochromator. The intensities were corrected for Lorentz-polarization, absorption and extinction effects.

The location of atoms, except oxygen, was determined by the three-dimensional Patterson method assuming a similarity to the LiNdP<sub>4</sub>O<sub>12</sub> structure (Koizumi, 1976). Structure factors based on the Patterson coordinates gave the conventional  $R$  value of 0.283. Successive Fourier syntheses clearly revealed the oxygen positions indicating tetrahedral coordination around the P atom.

All the atomic parameters were refined by the full-matrix least-squares method (Busing, Martin & Levy, 1962) to give  $R=0.028$ ,  $R_w=0.031$ . The final atomic parameters are listed in Table 2.\*

Crystal	Space group	$a$	$b$	$c$	$\beta$	$Z$
LiNdP <sub>4</sub> O <sub>12</sub> <sup>(a)</sup>	$I2/c$	9.844 Å	7.008 Å	13.25 Å	90.1°	4
LiNdP <sub>4</sub> O <sub>12</sub> <sup>(b)</sup>	$C2/c$	16.408	7.035	9.729	126.38	4
NaNdP <sub>4</sub> O <sub>12</sub> <sup>(c)</sup>	$P2_1/n$	9.907	13.10	7.201	90.51	4
KNdP <sub>4</sub> O <sub>12</sub> <sup>(d)</sup>	$P2_1$	7.266	8.436	8.007	91.97	2

**Discussion.** Bond distances and angles are given in Table 3 and Fig. 3. Views of the structure projected along the *c* and *b* axes are shown in Figs. 1 and 2, respectively.

The  $\text{NdO}_8$  dodecahedron is considerably distorted, as in  $\text{NdP}_5\text{O}_{14}$  (Hong, 1974). The dodecahedron shares all its oxygen atoms with the corners of neighbouring  $\text{PO}_4$  tetrahedra and with the faces of neighbouring Na polyhedra (Fig. 2).

The relative arrangement of  $\text{Nd}^{3+}$  and  $\text{Na}^+$  resembles that of the other alkaline Nd metaphosphates, in which the displacement of the alkaline ion from the axis of the  $\text{Nd}^{3+}-\text{M}^+$  ( $\text{M}^+$  stands for alkaline metal ion) zigzag chain increases with the ionic radius and coordination number of  $\text{M}^+$  [Table 4, Fig. 3(c)].

The Na polyhedron is also quite irregular, as are the K polyhedra in the  $\text{KNdP}_4\text{O}_{12}$  structure (Hong, 1975b). Five O atoms constitute the first coordination sphere around the  $\text{Na}^+$  ion at distances approx-

imately equal to the sum of the atomic radii,  $2.40 \sim 2.57 \text{ \AA}$ . The sixth bond makes the polyhedron into an octahedron and is substantially longer:  $2.72 \text{ \AA}$

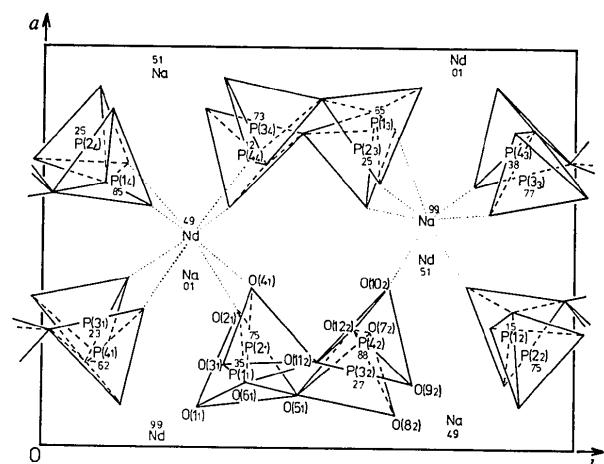

Fig. 1. Projection of the  $\text{NaNdP}_4\text{O}_{12}$  structure along [010].

Table 4. The relations between the ionic radius ( $r$ ) and the displacement of the alkaline ion ( $M^+$ ) from the axis of the  $\text{Nd}^{3+}-M^+$  zigzag chain ( $d$ ) in the  $\text{MNdP}_4\text{O}_{12}$  structure

	$\text{Li}^+$	$\text{Na}^+$	$\text{K}^+$
$r(\text{\AA})$	0.60	0.95	1.33
$d(\text{\AA})$	0	0.46	0.79
Coordination number ( $n$ )	4	6 + 1	7

(International Tables for X-ray Crystallography, 1962). Another oxygen atom [O(9)] lies at a distance of 3.02 Å [Fig. 3(b)]. This type of coordination around  $\text{Na}^+$  can also be seen in the structures of  $[\text{Na}_3\text{H}(\text{PO}_3)_4]_x$  (Jost, 1968) and  $\text{Na}_2\text{ZrSiO}_5$  (Treushnikov, Ilyukhin & Belov, 1970). The weaker bonds to  $\text{Na}^+$  cause a larger thermal motion ( $B_{\text{eq}}^{\text{Na}}$ : 2.43) compared with those of the other atoms ( $B_{\text{eq}}$ : 1.17 ~ 1.78). Such tendencies are also reported in the above-mentioned structures.

The helical  $(\text{PO}_3)_\infty$  chains in the  $\text{NaNdP}_4\text{O}_{12}$  structure are similar to those of the other alkaline Nd metaphosphates, in which the chains run along the shortest unit-cell directions. In the present structure the chain axis deviates considerably from the centre of each quarter cell and results in the formation of a larger tunnel along the  $c$  axis than is found in the  $\text{LiNdP}_4\text{O}_{12}$  structure.

It is to be noted that the adjacent  $\text{NdO}_8$  polyhedra do not share any oxygen atom as in the structures of  $\text{LiNdP}_4\text{O}_{12}$  and  $\text{KNdP}_4\text{O}_{12}$ . Although the shortest Nd–Nd distance (5.719 Å) is somewhat longer than that in  $\text{LiNdP}_4\text{O}_{12}$  (5.644 Å), the laser characteristics of the present crystal are less prominent than the latter (Hong, 1975a). This is related to the lower symmetry of the  $\text{NdO}_8$  dodecahedron and  $(\text{PO}_3)_\infty$  chains and, moreover, the larger interaction between  $\text{Nd}^{3+}$  and the alkaline ion ( $\text{Na}^+$ ).

The author is indebted to Mr J. Nakano who supplied the crystals and Mr T. Ogawa of Rigaku Denki Co., for the intensity measurements. He also wishes to express his gratitude to Dr N. Niizeki and Dr H. Iwasaki for their helpful discussions and encouragement.
