

naturally occurring assemblages are accompanied by photomicrographs of ore mineral suites. Apart from the brevity of the descriptions, the occurrences described are necessarily selective. However, an exhaustive treatment of this aspect was not the authors' objective. Again, many references to more detailed accounts are quoted.

In the final section of the book, the authors incorporate the 'natural assemblages' concept into their crystal-chemical classification to produce an overall classification system which they suggest fits best 'the peculiarities and genesis' of these minerals. All the sulphides known up to the end of January 1981 are tabulated according to this classification, together with their chemical formula, symmetry and unit-cell parameters.

Over 400 references constitute a most extensive source of information. However, the index is disappointing, consisting only of a list of mineral names and their major X-ray diffraction lines. There is no topic index and the entire central section on natural assemblages has been omitted from the index.

This is a well produced book, free from typographic errors. Those involved in sulphide mineralogy and crystal chemistry will find it a valuable source of reference. However, its appeal will probably be restricted to this group of specialists.

Topics in nucleic acid structure. Part 2. Edited by S. NEIDLE. Pp. ix + 309. London: Macmillan, 1982. Price £47.00.

This book is the second volume in what appears to be an excellent series on nucleic acid structure. It is geared for graduate students and researchers in the field, and, in fact, I have recently recommended two of the articles from it to be assigned reading for an international school on 'The Structure of Chromatin and DNA'. Its seven chapters cover a wide area of the field from analysis of the three-dimensional structures of nucleic acids and proteins through functional and topological implications of hairpin loops in supercoiled DNA.

Some of the topics covered include a timely review by D. Patel and his collaborators on the energetics and structural dynamics of the DNA double-helix dodecamer d(CGCGAATTCGCG) and selectively modified analogues of it. They focus on the power of techniques applied to nucleic acids in solution, e.g. NMR and differential scanning calorimetry, to elucidate structural information. In the case of DNA-B, this is especially important as at present only one such structure has been determined by X-ray crystallographic methods, i.e. this same dodecamer by R. Dickerson's group [Wing *et al.* (1980). *Nature (London)*, **286**, 567]. The conformational effects of single base insertions, i.e. precursors of 'nonsense' mutations, as well as the change from a G-C to a G-U base pair, i.e. a 'missense' mutation, are examined.

W. Olson gives a comprehensive review of theoretical studies on nucleic acid conformation covering potential-energy studies, chain statistics and model building. The conformational analysis of the building blocks of nucleic acids is examined in detail, paying special attention to the furanose ring, which plays a pivotal role in DNA and RNA structures. From this she goes on to build a coherent theoretical picture of the flexibility of long-chain polynucleotides including various models of novel helical structures as well as a model for the interconnection between right- and left-handed double-helical DNA structures.

H. T. Wright presents an in-depth look at four recently determined tRNA crystal structures and compares them with that of the first tRNA structure: yeast tRNA^{Phe}. These consist of chain *initiator* tRNA's from yeast and *E. coli*, and two yeast chain *elongator* tRNA's: tRNA^{Asp} and tRNA^{Gly}. He discusses "What is unique about initiator tRNA's" relative to chain elongators, and although the X-ray refinement is still in a preliminary stage and the crystallization conditions used are quite different from tRNA^{Phe}, he is able to point out some *key* differences between these two classes of tRNA's. In parallel for the newly determined chain *elongator* yeast tRNA^{Asp}, which was determined to higher resolution, he describes how the angle between the two major double-helical stems opens up, giving a kind of 'boomerang' shape to the structure as contrasted with the 'L' shape of tRNA^{Phe} and the two initiator tRNA's. The structure of yeast tRNA^{Gly}, grown from 50% dioxane, is also discussed. Here, however, due to the low resolution (4–5 Å) of the X-ray data, and the poor final figures of merit, 0.55, the author is extremely careful in not over-interpreting the structural results.

A. McPherson presents an up-to-date survey of crystallographic studies on nucleic acid binding proteins. In order to give some experimental feel for the quality of the work, he includes photographs of the protein crystals and X-ray diffraction patterns, as well as a schematic illustration of a model of the current state of each structure.

Additional topics include 'Hairpin Loops in Supercoiled DNA' by D. M. J. Lilley, 'Recognition of Natural and Chemically-Damaged Nucleic Acids by Peptides and Proteins' by C. Hélène and collaborators, and a paper by D. Rhodes on 'The Helical Periodicities of DNA in Solution and in Chromatin'.

Dr Neidle has done an excellent job editing this volume, which is also quite well illustrated. It should reside in most technical libraries and the personal collections of serious researchers in the field.
