

The conformation along with the helicity (IUPAC, 1970) adopted by the chelate rings are as follows:

Ring	Conformation	Helicity
N(3) — Cu — N(2)	Envelope (or gauche)	λ
N(2) — Cu — N(1)	Envelope (or gauche)	δ
N(1) — Cu — O(1)	Nearly planar with boat deformation	Non-helical.

The three Cu—N bonds are not equivalent: two Cu—N(amine) bond distances [Cu—N(2) and Cu—N(3)] are comparable while the third [Cu—N(1)] is significantly shorter and comparable with the Cu—O(1) bond distance in the basal plane.

The coordination polyhedron around Cu is a square pyramid whose base is formed by one O and three N atoms from the saldien ligand; the apical position is occupied by the O atom of a water molecule bound to metal as shown in Fig. 2, which represents a view of the asymmetric unit projected onto the saldien plane.

The Cu—O(2)(water) bond distance compares well with the value 2.359 (8) Å found in aqua[3,6-bis(2-pyridyl)pyridazine]trichlorohydroxodicopper(II) (Ghedini, De Munno, Denti, Manotti Lanfredi & Tiripicchio, 1982) for a similar distance. Bond distances and angles in the ligand are in agreement with those reported in analogous compounds.

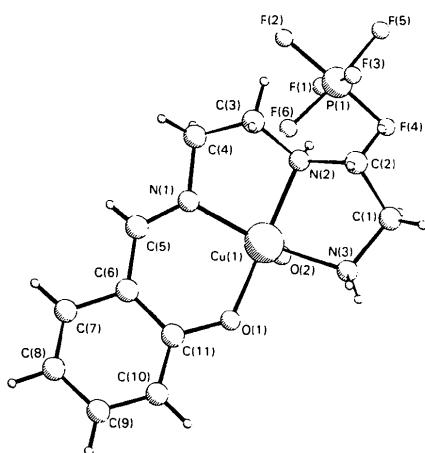

Fig. 2. The asymmetric unit projected onto the saldien plane.

Structure of Bis(tetraphenylphosphonium) Tris[chlorocopper(I)]tetrathiomolybdate(VI)* Methyl Cyanide Solvate, [Ph₄P]₂[MoS₄(CuCl)₃]·CH₃CN

BY WILLIAM CLEGG

Institut für Anorganische Chemie der Universität, Tammannstrasse 4, D-3400 Göttingen, Federal Republic of Germany

AND C. DAVID GARNER AND JOHN R. NICHOLSON

Department of Chemistry, University of Manchester, Manchester M13 9PL, England

(Received 10 December 1982; accepted 24 January 1983)

Abstract. $M_r = 1241.0$, monoclinic, $P2/n$, $a = 17.044 (2)$, $b = 13.546 (2)$, $c = 22.826 (3)$ Å, $\beta = 96.46 (1)^\circ$, $U = 5236.6$ Å³, $Z = 4$, $D_x =$

1.574 Mg m⁻³; Mo $K\alpha$ radiation, $\lambda = 0.71069$ Å, $\mu = 1.84$ mm⁻¹, $F(000) = 2495.5$, $T = 291$ K; $R = 0.068$ for 6091 reflections. The two crystallographically independent anions lie on twofold axes; each consists of an essentially tetrahedral MoS₄ arrangement, for which three of the six S···S edges are bridged by CuCl.

* IUPAC name:bis(tetraphenylphosphonium) [1,2,3-trichloro-1,2;2,3-di- μ -thio-1,3-dithiotricuprato(I)-S¹,S²,S³,S⁴]molybdate(2-).

Introduction. The structure was investigated as part of a continuing research into Cu–Mo–S systems, which may be relevant to the biological antagonism between copper and molybdenum (Mills, Bremner, El-Gallad, Dalgarno & Young, 1978; Mills, 1979; Acott, Garner, Nicholson & Clegg, 1983). Thus, several $[X\text{Cu}_n\text{MoS}_4]^{2-}$ complexes have been prepared by us and are under investigation.

Experimental. The complex was prepared from $[\text{Ph}_4\text{P}]_2[\text{MoS}_4]$ and CuCl (*ca* 1:3 molar ratio) in CH_3CN and recrystallized as dark-red blocks from CH_3CN . Chemical-analysis figures were in agreement with the formula given.

Data collection: crystal $0.27 \times 0.40 \times 0.42$ mm, Stoe–Siemens AED diffractometer. Unit-cell parameters derived from 2θ angles of 48 reflections centred at $\pm\omega$ ($20 < 2\theta < 25^\circ$). Intensities measured by profile analysis (Clegg, 1981) for 9934 reflections with $2\theta < 50^\circ$, $h \leq 0$, $k \geq 0$; no significant intensity variation for three standard reflections.

Data reduction: empirical absorption correction based on 276 azimuthal scan data; transmission 0.383 – 0.412 . $R_{\text{int}} = 0.042$ ($0kl$ reflections only); 9191 unique reflections, 6091 with $F > 4\sigma(F)$.

Structure solution and refinement: some heavier atoms from automatic direct methods; difference syntheses; blocked-cascade refinement to minimize $\sum w\Delta^2$ with $\Delta = |F_o| - |F_c|$; $w^{-1} = \sigma_F^2 + 0.00096F^2$. Phenyl groups as rigid ideal hexagons, $\text{C}=\text{C}=1.395$ Å, $\text{C}-\text{H}=0.96$ Å on external $\text{C}-\text{C}-\text{C}$ angle bisectors. Anisotropic thermal parameters for all non-H atoms; $U(\text{H}) = 1.2U_{\text{eq}}(\text{C})$. No extinction correction. Two phenyl groups refined with twofold disorder of orientation [occupation factors 0.501 (5) and 0.523 (4) for major components]. CH_3CN as rigid group with $\text{C}=\text{C}=1.47$ Å, $\text{C}-\text{N}=1.15$ Å, $\text{C}-\text{C}-\text{N}=180^\circ$, no H atoms included. 567 parameters, $R=0.068$, $wR=0.081$, slope of normal probability plot = 1.49. Max.(shift/e.s.d.) = 0.02, mean = 0.004. Largest peak in final difference map = 0.78 e Å $^{-3}$, largest hole = -1.10 e Å $^{-3}$. Scattering factors from *International Tables for X-ray Crystallography* (1974).

Programs: *SHELXTL* by Professor G. M. Sheldrick (Göttingen), diffractometer control program by W. Clegg; Data General Eclipse and Nova computers.

Discussion. Atomic coordinates, and bond lengths and angles for the anions, are given in Tables 1 and 2.* One of the two crystallographically independent anions is shown in Fig. 1. Each lies on a twofold axis, which passes through Mo and a CuCl group. The MoS_4 unit is

Table 1. *Atomic coordinates ($\times 10^4$) and equivalent isotropic thermal parameters ($\text{\AA}^2 \times 10^4$)*

$U_{\text{eq}} = \frac{1}{3}(\text{trace of the orthogonalized } U_{ij} \text{ matrix})$.

essentially tetrahedral; two opposite S...S edges are bridged by CuCl groups, as is a third edge, in such a way that two S atoms are bonded to Mo and one Cu, the other two to Mo and two Cu atoms. This arrangement appears to be the first such example for a

M_3MoS_4 complex, and is in contrast to that found for $(Ph_3PCu)_3MoS_3XCl$ ($X = S$ or O), in which the Mo, 3Cu, 3S and Cl atoms form a cubane-like core and the O or fourth S atom is non-bridging (Müller, Bögge & Schimanski, 1980; Müller, Bögge, Tolle, Jostes, Schimanski & Dartmann, 1980). The S–Mo–S angles which are bridged by CuCl are all smaller than those which are open. Mo–S bonds involving triply bonded S are longer than those for doubly bonded S. This angular and radial distortion of the central MoS_4^{2-} unit from a regular tetrahedral geometry affects its spectroscopic properties (Clegg, Garner & Nicholson, 1983).

We thank the SERC and the Verband der Chemischen Industrie for financial support.
