(Received 15 April 1982; accepted 28 March 1983)

**Abstract.**  $M_r = 375.47$ , monoclinic,  $P2_1$ ,  $a = 13.364(2)$ ,  $b = 5.763(1)$ ,  $c = 14.599(3)\text{ \AA}$ ,  $\beta = 111.17(1)^\circ$ ,  $V = 1048.5\text{ \AA}^3$ ,  $Z = 2$ ,  $D_x = 1.189\text{ Mg m}^{-3}$ ,  $\lambda(\text{Cu } K\alpha) = 1.5418\text{ \AA}$ ,  $\mu = 0.631\text{ mm}^{-1}$ ,  $F(000) = 400$ ,  $T = 293\text{ K}$ . Final  $R = 0.039$  for 1223 observed reflexions. The oxazolidine ring is in the half-chair conformation.

**Introduction.** It was found earlier that in the course of a three-component reaction between *p*-methoxybenzaldehyde, *N*-(*p*-methoxybenzylidene)methylamine and phenylmethylene (in the form of a copper carbenoid), [2 + 3] cycloaddition of the azomethine ylide intermediate 1 to the carbonyl group resulted in the formation of an unstable diastereoisomer of the 1,3-oxazolidine derivative 2. The latter compound easily isomerized at room temperature forming the more stable diastereoisomer 3 which was finally isolated from the reaction mixture [Bartnik & Młostóń (1983); see also preliminary communication, Bartnik & Młostóń (1981)].

The molecular structure of the diastereoisomer 3 established on the basis of X-ray studies would allow us to describe a steric structure for the unstable form 2 (by

comparison with NMR data) and consequently to predict the orientation of the reagents on the [2 + 3] cycloaddition step. This paper is a continuation of earlier published (Skarżyński, 1982*a,b*; Skarżyński, Derewenda, Brzozowski & Młostóń, 1982) structural studies of 1,3-oxazolidine derivatives.

**Experimental.** Investigated oxazolidine derivative obtained by GM, recrystallized from ethanol, m.p. 367–368 K, colourless crystal, equidimensional in habit, approx.  $0.2 \times 0.2 \times 0.3\text{ mm}$ ; space group and approximate lattice parameters obtained from oscillation and Weissenberg photographs; cell parameters and intensity data measured on an Enraf–Nonius CAD-4 diffractometer, Cu  $K\alpha$  radiation, graphite monochromator; accurate lattice parameters determined by a least-squares refinement of 25 reflexions; total of 2189 independent reflexions measured to a  $\theta$  limit of  $70^\circ$ , data not corrected for absorption, 1223 reflexions with  $I > 2.5\sigma(I)$  used in refinement calculations [minimizing  $\sum w(\Delta F)^2$ ]; solution by direct methods using MULTAN76 (Main, Woolfson, Lessinger, Germain & Declercq, 1976) and refined by full-matrix least-squares procedure with weights derived from counting statistics; after initial anisotropic refinement of non-H atoms, a difference synthesis at  $R = 0.09$  revealed positions of all H atoms; in subsequent cycles of refinement H atoms allowed to refine isotropically, and weighting scheme of the form  $w = 1/[\sigma^2(F) + pF^2]$  employed with  $p = 0.001$ ; final  $R = R_w = 0.039$ ; difference map calculated after last cycle of refinement devoid of any significant features.

Table 1. Final fractional coordinates ( $\times 10^4$ ) and mean isotropic temperature factors ( $\times 10^3$ ) with e.s.d.'s in parentheses

For non-H atoms  $U_{iso} = \frac{1}{3}(U_{11} + U_{22} + U_{33})$ .

**Discussion.** The final coordinates with e.s.d.'s are listed in Table 1\* with atoms numbered arbitrarily as shown in Fig. 1. Bond lengths and angles are given in Table 2.

The *p*-methoxyphenyl substituents bound to atoms C(2) and C(3) are in the *trans* configuration, whereas the phenyl group bound to C(1) is in the *cis* configuration with respect to the *p*-methoxyphenyl of C(3) and in the *trans* configuration with respect to the methyl group bound to N(1). The angles between the best planes fitted by least squares through the phenyl rings are:  $\angle I, II = 50.4$  (2),  $\angle I, III = 17.0$  (2),  $\angle II, III = 65.3$  (2)°, where I, II and III represent the phenyl rings connected to atoms C(1), C(2) and C(3), respectively. The oxazolidine ring is in an almost ideal half-chair conformation, with atoms N and C(3) displaced by 0.32 (2) and 0.36 (2) Å on opposite sides of the plane through C(1), O and C(2).

The authors wish to thank Dr M. Hursthouse for data collection.

(Received 16 February 1983; accepted 28 March 1983)

**Abstract.**  $M_r = 392.46$ , orthorhombic,  $Cmc2_1$ ,  $a = 23.444(6)$ ,  $b = 10.852(3)$ ,  $c = 7.983(2)$  Å,  $V = 2031.0$  Å<sup>3</sup>,  $Z = 4$ ,  $D_x = 1.283$  Mg m<sup>-3</sup>,  $\lambda(\text{Mo K}\alpha) = 0.71069$  Å,  $\mu = 0.083$  mm<sup>-1</sup>,  $F(000) = 832$ ,  $T = 291$  K,  $R = 0.034$  for 1601 reflections. With a crystallographic mirror generating the second half of the molecule, the macrocycle adopts a ‘dentist’s chair’ conformation in which the five hetero-atoms are co-planar to within  $\pm 0.008$  Å.

**Introduction.** The pyridino analogue (2) [in which the ‘inner’ C(10) is replaced by N] of the title ligand (1) forms a variety of adducts (including clathrates) with small neutral molecules (Vögtle, Müller & Weber, 1980), but the title ligand itself does not. In general, crown ethers based on xylene compounds reveal a relatively low coordination ability (e.g. Cram & Cram, 1978; cf. van Zon, de Jong, Reinhoudt, Torny & Onwezen, 1981; de Boer, Reinhoudt, Harkema, van Hummel & de Jong, 1982), and few structures of such complexes with H-bond donors are known (e.g. Goldberg, 1975; Reinhoudt, den Hertog & de Jong, 1981). Hence it seems that the pyridine base plays an important rôle in secondary interactions, particularly in the uptake of alcohols (Weber & Vögtle, 1980; Weber, Vögtle, Josel, Newkome & Puckett, 1983), though a methanol complex of a bicyclic polyether containing only O as hetero-atoms has recently been reported (Bandy, Hughes & Truter, 1982).

An X-ray analysis of the present compound (1) might, therefore, provide structural information as to the differing coordination behaviours of (1) and (2).

(1)

**Experimental.** Sample kindly provided by Dr E. Weber (no relation), University of Bonn, D-5300 Federal Republic of Germany, crystal  $ca\ 0.6 \times 0.6 \times 0.4$  mm, grown from methanol/ethyl acetate; Stoe four-circle diffractometer, cell dimensions from  $2\theta$  angles for 36 reflections ( $20 < 2\theta < 25^\circ$ ); 4308 profile-fitted (Clegg, 1981) data up to  $2\theta = 50^\circ$  (excluding systematic absences),  $-27 \leq h \leq 27$ ,  $-2 \leq k \leq 12$ ,  $-9 \leq l \leq 9$ , 1826 unique ( $R_{\text{int}} = 0.019$ ), 1601 intensities  $> 2\sigma(I)$ ; structure solved by multisolution direct methods and refined anisotropically by blocked-cascade least squares on F, H atoms included in idealized positions (C–H = 0.96 Å) as ‘riding atoms’ [except H(10) refined freely],  $U(H_i) = 1.2 U_{\text{eq}}(C_i)$ ; empirical extinction correction coefficient  $x = 5.6(2) \times 10^{-6}$ , where  $F' = F/(1.0 + xF^2/\sin 2\theta)^{0.25}$ ; 138 parameters,  $wR = 0.031$ ,  $w^{-1} = \sigma^2(F) + 0.00015F^2$ ,  $S = 1.42$ , slope of normal probability plot = 1.29, max. shift/e.s.d. = 0.04, mean 0.007, largest peak/hole  $\leq 0.22$  e Å<sup>-3</sup>; scattering factors from *International Tables for X-ray Crystallography* (1974), program for structure solution, refinement, etc. (*SHELXTL*) written by Professor G. M. Sheldrick, for diffractometer control by Dr W. Clegg, University of Göttingen.
