(Received 26 September 1983; accepted 20 December 1983)

**Abstract.**  $M_r = 260.30$ , monoclinic,  $P2_1/n$ ,  $a = 11.415$  (2),  $b = 15.401$  (3),  $c = 7.751$  (1) Å,  $\beta = 96.90$  (1)°,  $V = 1352.8$  (4) Å<sup>3</sup>,  $Z = 4$ ,  $D_x = 1.278$  g cm<sup>-3</sup>,  $\text{Cu } K\alpha$ ,  $\lambda = 1.54178$  Å,  $\mu = 6.43$  cm<sup>-1</sup>,  $F(000) = 544$ , room temperature,  $R = 0.040$  for 1508 unique reflections with  $I > 3\sigma(I)$ . The tetracyanoethylene adduct contains a four-membered ring with three long C–C distances of 1.581 (3), 1.582 (3) and 1.596 (3) Å. Both N–C–C–N moieties are planar and almost perpendicular to the four-membered ring and to each other. Although there is little steric hindrance within the molecule, there is considerable angle strain as evidenced by the fourteen C(sp<sup>3</sup>) valence angles of less than 104°.

**Introduction.** The least reactive isomer (1) of isodicyclopentadiene (Bartlett & Wu, 1984*a*) reacts with tetracyanoethylene (TCNE) at 273 K in acetonitrile to form adduct (2). In the presence of polar solvents (2) rearranges to form the title compound (3) (Bartlett &

Wu, 1984*b*). Both steps in this reaction are solvent dependent.

**Experimental.** Bipyramidal-shaped crystal, 0.6 × 0.3 × 0.3 mm, Syntex  $P2_1$  diffractometer,  $\theta:2\theta$  scan, variable scan rate,  $2\theta_{\text{max}} = 120^\circ$ , graphite-monochromated  $\text{Cu } K\alpha$  radiation; lattice parameters from least squares of 15 medium-angle reflections with angles measured by centering routine associated with the diffractometer system (systematic absences  $h + l = 2n + 1$  for  $h0l$ ); monitored reflections showed no change in intensity greater than  $3\sigma(I)$ ; 1842 independent reflections ( $0 \leq h \leq 12$ ,  $0 \leq k \leq 16$ ,  $-8 \leq l \leq 8$ ), 1508 with intensities  $> 3\sigma(I)$ ; Lorentz and polarization but no absorption corrections; direct methods (*MULTAN78*: Main, Hull, Lessinger, Germain, Declercq & Woolfson, 1978) located all heavy atoms; H atoms located in difference synthesis but not refined, full-matrix least-squares anisotropic refinement;  $\sum w(|F_o| - |F_c|)^2$  minimized,  $w = 1/\sigma^2(F_o)$ ; 181 parameters refined, final  $R = 0.040$ ,  $R_w = 0.059$ ,  $S = 2.79$ ,  $(\Delta/\sigma)_{\text{av}} = 0.014$ ,  $(\Delta/\sigma)_{\text{max}} = 0.12$ , highest peak in difference Fourier map  $0.17 \text{ e } \text{Å}^{-3}$ ; locally written programs used for data reduction and initial block-diagonal least-squares refinement, *MULTAN78* for direct-methods calculations and *XRAY76* (Stewart, Machin, Dickinson, Ammon, Heck & Flack, 1976) for all other computations; atomic scattering factors for C, O and N from Cromer & Mann (1968), for H from Stewart, Davidson & Simpson (1965). Table 1 lists atomic positional parameters and  $U_{\text{eq}}$  values while Table 2 gives bond lengths and valence angles.†

**Discussion.** Fig. 1 is an ORTEP (Johnson, 1971) drawing of the title compound. The cyclopentene system is *cis* fused to the norbornane moiety. The five-membered ring is nearly planar [maximum deviation 0.04 (1)  $\text{\AA}$ ] with C(5)–C(6) = 1.308 (4)  $\text{\AA}$ . The four-membered ring is slightly puckered [maximum deviation from planarity 0.04 (1)  $\text{\AA}$ ], and the four- and five-membered rings form an interplanar angle of 118.1 (6)°. The C(1)–C(2), C(2)–C(3) and C(3)–

C(4) bond distances associated with the TCNE moiety are 1.581 (3), 1.596 (3) and 1.582 (3)  $\text{\AA}$ , respectively, which reflects the electron-withdrawing character of the four cyano groups and the strain in the four-membered ring. The two N–C–C–N units are planar [maximum deviation 0.02 (1)  $\text{\AA}$ ] and are almost perpendicular, interplanar angle = 88.0 (5)°. The plane containing C(2) makes an angle of 91.2 (5)° with the four-membered ring while that containing C(3) makes an angle of 92.4 (5)°. The four C(*sp*<sup>3</sup>)–C(*sp*) distances in the TCNE unit of 1.459 (3) to 1.470 (3)  $\text{\AA}$  can be compared with the 1.445 (4) to 1.451 (4)  $\text{\AA}$  range observed for 1,1,2,2-tetracyanocyclopropane (Wang & Stucky, 1973) and the 1.463 (6) to 1.511 (6)  $\text{\AA}$  range for a TCNE reaction product (Karle, Flippen, Huisgen & Schug, 1975). The four C≡N distances of 1.131 (4) to 1.137 (2)  $\text{\AA}$  may be compared with the 1.134 (3) to 1.141 (3)  $\text{\AA}$  and 1.109 (6) to 1.146 (6)  $\text{\AA}$  ranges observed for the two structures cited above.

The cyclohexane ring is held in a boat conformation by the methylene bridge. The interplanar angles involving C(11)C(1)C(7)C(8) *A*, C(8)C(12)C(11) *B*, and C(8)C(9)C(10)C(11) *C* are *A*, *B* = 121.1 (5), *B*, *C* = 125.0 (5) and *A*, *C* = 113.9 (6)°. Other than H(4)⋯H(10a) = 2.28 (4)  $\text{\AA}$  and H(11)⋯C(14) = 2.44 (4)  $\text{\AA}$  there are no unusually short intramolecular contacts. Although there is little steric hindrance within the molecule, the fusion of small rings with fourteen C(*sp*<sup>3</sup>) valence angles of less than 104° leads to considerable strain. There is a short intermolecular contact of 2.22 (4)  $\text{\AA}$  between H(5) of one molecule and H(12a) of another and five additional hydrogen-atom contacts which lie between 2.45 (4) and 2.70 (4)  $\text{\AA}$ .

We thank The Robert A. Welch Foundation (P-074) for their financial support. This is FASTBIOS contribution No. 119.

Fig. 1. ORTEP drawing of compound (3). Thermal ellipsoids are drawn at the 50% probability level.

**Abstract.**  $M_r = 260.30$ , monoclinic,  $P2_1/c$ ,  $a = 18.123$  (5),  $b = 13.509$  (3),  $c = 12.073$  (2) Å,  $\beta = 109.35$  (3)°,  $V = 2789$  (1) Å<sup>3</sup>,  $Z = 8$ ,  $D_x = 1.240$  g cm<sup>-3</sup>,  $\text{Cu } K\alpha$ ,  $\lambda = 1.54178$  Å,  $\mu = 6.24$  cm<sup>-1</sup>,  $F(000) = 1088$ , room temperature, two independent molecules per asymmetric unit,  $R = 0.043$  for 2497 unique reflections with  $I > 3\sigma(I)$ . The central  $\pi$  system in the *anti*-sesquinorbornene derivative deviates from planarity by approximately 4°. This is attributed primarily to an interaction between the central  $\pi$  bond and the  $\pi$  system of the cyano groups. The electron-withdrawing character of the cyano groups may account for the elongation of three C–C bonds in each molecule which range from 1.591 (3) to 1.609 (4) Å.

**Introduction.** Isodicyclopentadiene (1) reacts rapidly with tetracyanoethylene (TCNE) in benzene to yield a mixture of isomers (2) and (3) (Bartlett & Wu, 1984). When the reaction is followed by <sup>1</sup>H or <sup>13</sup>C NMR it is found that (3) forms exclusively at the beginning, then slowly rearranges to (2). An 87:13 equilibrium mixture of 3:2 was obtained. To our knowledge, this is the first example in which a dienophile preferentially cycloadds to the *exo* face of (1) (Sugimoto, Kobuke & Furukawa, 1976; Paquette, Carr, Böhm & Gleiter, 1980; Watson, Galloy, Bartlett & Roof, 1981).

**Experimental.** Pyramidal-shaped crystal,  $0.38 \times 0.30 \times 0.25$  mm, Syntex  $P2_1$  diffractometer,  $\theta:2\theta$  scan, variable scan rate,  $2\theta_{\text{max}} = 120^\circ$ , graphite-monochromated  $\text{Cu } K\alpha$  radiation; lattice parameters from

least squares of 15 medium-angle reflections with angles measured by centering routine associated with the diffractometer system (systematic absences  $l = 2n + 1$  for  $h0l$  and  $k = 2n + 1$  for  $0k0$ ); monitored reflection showed no change in intensity greater than  $3\sigma(I)$ ; 3810 independent reflections ( $0 \leq h \leq 19$ ,  $0 \leq k \leq 14$ ,  $-12 \leq l \leq 12$ ), 2497 with  $I > 3\sigma(I)$ ; Lorentz and polarization, no absorption corrections; direct methods (*MULTAN78*: Main, Hull, Lessinger, Germain, Declercq & Woolfson, 1978) located all heavy atoms; hydrogen atom positions located in difference map but not refined in full-matrix least-squares anisotropic refinement;  $\sum w(|F_o| - |F_c|)^2$  minimized,  $w = 1/\sigma^2(F_o)$ ; 361 parameters refined;  $R = 0.043$ ,  $R_w = 0.048$ ,  $S = 1.92$ ,  $(\Delta/\sigma)_{\text{av}} = 0.057$ ,  $(\Delta/\sigma)_{\text{max}} = 0.21$ ; highest peak in final difference map  $0.15 \text{ e } \text{Å}^{-3}$ ; locally written programs used for data reduction and initial block-diagonal least-squares refinement, *MULTAN78* for direct-methods calculations and *XRAY76* (Stewart,
