# 2,5-Bis(4-nitrophenyl)-3,4-diphenylthiophene 

By Patrice de Meester, Noormahmad N. Maldar, Narayan S. Hosmane* and Shirley S. C. Chu<br>Departments of Chemistry and Electrical Engineering, Southern Methodist University, Dallas, Texas 75275, USA

(Received 1 July 1985; accepted 24 October 1985)

#### Abstract

C}_{28} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S}, M_{\mathrm{r}}=478.52\), orthorhombic, Pbcn, $a=24.507$ (4), $b=10.945$ (2), $c=8.835$ (1) $\AA$, $V=2369.8$ (7) $\AA^{3}, \quad Z=4, \quad D_{x}=1.341 \mathrm{~g} \mathrm{~cm}^{-3}$, $\lambda($ Mo $K \alpha)=0.71069 \AA, \mu=1.66 \mathrm{~cm}^{-1}, F(000)=992$, $T=295$ K. Final $R=0.040$ for 980 observed reffections. The structure shows that the 4 -nitrophenyl groups are attached to positions 2 and 5 of the thiophene ring selectively. The bond distances in the thiophene ring are: $\mathrm{S}-\mathrm{C}, 1.724$ (3); $\mathrm{C}=\mathrm{C}, 1.381$ (4) and $\mathrm{C}-\mathrm{C}, 1.429$ (3) $\AA$ and the angle $\mathrm{C}-\mathrm{S}-\mathrm{C}$ is $93.0(1)^{\circ}$.

Introduction. A number of reactions between aryl and alkyl diisocyanates with glycols leading to the formation of polyurethanes have been reported (Lenz, 1967; Smith, 1963; Burkus \& Eckert, 1958). Recently, 2,5-bis (4-isocyanatophenyl)-3,4-diphenylthiophene (I) has been synthesized (Maldar \& Hosmane, 1986) in our laboratory from 2,5-bis(4-nitrophenyl)-3,4diphenylthiophene (II) which is a bright-yellow airstable solid. The preparation of this dinitro derivative (II) has been described elsewhere (Dilthey \& Graef, 1938).

(II)

The diamino derivative of (II) has been allowed to react with aromatic dianhydrides, dialdehydes and diacid chlorides to yield polyimides, polyazomethines and polyamides, respectively (Imai, Maldar \& Kakimoto, 1984, 1985; Kakimoto, Negi \& Imai, 1985). For example, the polycondensation of diamine $\mathrm{H}_{2} \mathrm{~N}-$ $R-\mathrm{NH}_{2}$ with diacid chloride $\mathrm{Cl}(\mathrm{O}) \mathrm{C}-R^{\prime}-\mathrm{C}(\mathrm{O}) \mathrm{Cl}$ yields the polyamide $\left(R-\mathrm{NH}-\mathrm{CO}-\mathrm{R}^{\prime}-\mathrm{CO}-\mathrm{NH}\right){ }_{n}$. Our recent ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR investigations suggested that the 4 -nitrophenyl group is attached to the thiophene ring preferentially at positions 2 and 5. In

[^0]0108-2701/86/030363-02\$01.50
order to confirm this selectivity and to provide definitive characterization of (I) and (II), we have conducted an X-ray investigation of the title compound (II) and report herein the results.

Experimental. Crystals of the title compound are yellow rectangular plates. Unit-cell parameters by leastsquares fit of 15 reflections in range $11<2 \theta<22^{\circ}$, space group Pbcn from systematic absences ( $0 \mathrm{kl}, \mathrm{k}$ odd; $h 0 l, l$ odd and $h k 0, h+k$ odd). Crystals $0.55 \times 0.29 \times 0.15 \mathrm{~mm}$, automatic Syntex $P 2_{1}$ diffractometer, graphite-monochromatized Mo $K \alpha$ radiation, $\theta / 2 \theta$ scanning mode, 1564 independent reflections in range $3<2 \theta<45^{\circ}$, $h k l$ range $h 0 \rightarrow 26, k 0 \rightarrow 11, l 0 \rightarrow 9$, 980 observed reflections with $I>3 \sigma(I), \sigma(I)$ from counting statistics, three standard reflections remeasured every 100 reflections showed a random variation of less than $3 \%$ in intensity, Lorentzpolarization correction, no absorption correction, direct-methods MULTAN78 (Main, Hull, Lessinger, Germain, Declercq \& Woolfson, 1978), refinement by full-matrix least squares using SHELX76 (Sheldrick, 1976), anisotropic, H atoms located in difference Fourier maps, isotropic temperature factors for H , $w=1 / \sigma^{2}(F), \sum w\left(\left|F_{o}\right|-\left|F_{c}\right|\right)^{2}$ minimized, $R=0.040$, $w R=0.033$. Two strong low-angle reflections 202 and 302 , possibly affected by extinction with $\Delta F=-30$ and -21 respectively, were taken out during the final refinement. $(\Delta / \sigma)_{\text {max }}=0 \cdot 19$, max. height in final difference Fourier map $0.19 \mathrm{e} \AA^{-3}$. Atomic scattering factors for $\mathrm{C}, \mathrm{H}, \mathrm{O}, \mathrm{N}$ and S and the effects of the anomalous-dispersion correction for S used were those stored in SHELX76.

Discussion. The final atomic parameters are given in Table $1 . \dagger$ The identification of the atoms and the configuration of the molecule are shown in the ORTEP (Johnson, 1965) drawing of Fig. 1. The molecule lies on a diad axis which passes through the $S$ atom and the center of the $\mathrm{C}(2)-\mathrm{C}\left(2^{\prime}\right)$ bond. The bond lengths, bond

[^1]© 1986 International Union of Crystallography
angles, and selected torsion angles with their standard deviations are given in Table 2. The geometry of the thiophene ring is in good agreement with the data obtained for thiophene by electron diffraction (Harshbarger \& Bauer, 1970). The $\mathrm{C}-\mathrm{S}$ and $\mathrm{C}=\mathrm{C}$ distances of 1.724 (3) and 1.381 (4) $\AA$ are similar to the average distances of 1.717 (4) and 1.368 (4) $\AA$ found for the same bonds in thiophene. The angle between the phenyl and thiophene rings is $-72.0(1)^{\circ}$ while that between the nitrophenyl and thiophene rings is $26.6(1)^{\circ}$. The angle between the nitro group and the phenyl ring to which it is attached is $1.0(5)^{\circ}$.
