SHORT-FORMAT PAPERS

Contributions intended for publication under this heading should follow the format given in the Checklist for Authors [*Acta Cryst.* (1985). C41, 1–4].

Acta Cryst. (1986). C42, 376–378

Structure of 5,11-Bis(chloroformyl)-2,8-dimethyl-6*H*,12*H*-dibenzo[*b,f*][1,5]diazocine at 163 K

BY S. B. LARSON* AND C. S. WILCOX

Department of Chemistry, University of Texas at Austin, Austin, TX 78712, USA

(Received 19 September 1985; accepted 10 October 1985)

Abstract. $C_{18}H_{16}Cl_2N_2O_2$, $M_r = 363.24$, monoclinic, $P2_1/c$, $a = 10.0742$ (15), $b = 9.9129$ (18), $c = 8.1320$ (12) Å, $\beta = 95.581$ (10)°, $V = 808.2$ (2) Å³, $Z = 2$, $D_x = 1.492$, D_m (295 K) = 1.424 g cm⁻³, $\lambda(MoK\alpha) = 0.71079$ Å, $\mu = 4.133$ cm⁻¹, $F(000) = 376$, $R = 0.0378$ for 1916 observed reflections. Molecules have a center of symmetry. The eight-membered central ring is in a chair conformation. The planes of the NCOCl groups make angles of 65.79 (4)° with the planes of the benzo bridges such that the Cl and O atoms are in van der Waals contact with the intramolecular H atoms [Cl...H(2), 3.02 (2); O...H(7B), 2.51 (2) Å]. The configuration at N is essentially planar and conjugation is evident in the shortened N—C(benzo) and N—C(carbonyl) bonds [1.439 (2) and 1.347 (2) Å respectively].

Experimental. Title compound prepared by method of Cooper & Partridge (1957). Data crystal obtained by cutting a corner from a large blocky crystal. A summary of data collection and structural refinement is given in Table 1.

* Current address: Nucleic Acid Research Institute, Costa Mesa, CA 92626, USA.

Structure solved by MULTAN78 (Main, Hull, Lessinger, Germain, Declercq & Woolfson, 1978) and Fourier techniques; refined by full-matrix least squares (SHELEX76, Sheldrick, 1976); all atomic positional parameters refined as well as anisotropic thermal parameters for non-H atoms and isotropic for H atoms. Electron density difference map calculated at $R = 0.06$ revealed H atoms as peaks of 0.67–1.02 e Å⁻³. Scattering factors and anomalous-dispersion corrections for all non-H atoms from *International Tables for X-ray Crystallography* (1974); H scattering factors from Stewart, Davidson & Simpson (1965). Atomic parameters are in Table 2, bond lengths and angles in Table 3.† Atom labeling is shown in Fig. 1 and packing in Fig. 2. Principal computer programs given by Gadol & Davis (1982); program for least-squares-planes' calculations from Cordes (1983).

† Tables of anisotropic thermal parameters, hydrogen bond lengths and angles, torsion angles, least-squares planes and structure-factor amplitudes have been deposited with the British Library Lending Division as Supplementary Publication No. SUP 42575 (18 pp.). Copies may be obtained through The Executive Secretary, International Union of Crystallography, 5 Abbey Square, Chester CH1 2HU, England.

Table 1. Crystallographic summary for $C_{18}H_{16}Cl_2N_2O_2$ (A) Data collection (163 K)^{a,b}

Mode	ω scan
Scan range	Symmetrically over 1.2° about $Ku_{1,2}$ maximum
Background	Offset 1.2° and -1.2° in ω from $Ku_{1,2}$ maximum
Scan rate ($^\circ \text{min}^{-1}$)	3.0–6.0
Exposure time (h)	37.1
Stability analysis ^c	
Check reflections	002,020,400,221
Computed s	-0.0003 (2)
t	0.000005 (5)
Correction range (on I)	1.000–1.004
2θ range ($^\circ$)	4.0–60.0
Range in hkl , min.	0.0–11
max.	14,13,11
Total reflections measured, unique	2357, 2357
Crystal volume (mm^3)	0.0180
Crystal faces, dimensions (mm)	{100}, 0.24; {011}, (011), 0.23; (011), ~(011), 0.30
Absorption correction,	
transmission-factor range	0.906–0.921

(B) Structure refinement^c

Instability factor p^b	0.04
Reflections used ($F \geq 4\sigma_F$)	1916
No. of variables	141
Goodness of fit, S	1.462
R , wR	0.0378, 0.0455
R for all data	0.0504
Max. shift/e.s.d.	0.011
Max., min. in difference map ($e \text{ \AA}^{-3}$)	0.46, -0.21

Notes: (a) Unit-cell parameters were obtained by least-squares refinement of the setting angles of 45 reflections with $21.4 < 2\theta < 30.6^\circ$. Crystal density was measured by flotation in aqueous $ZnCl_2$. (b) Syntex $P2_1$ auto-diffractometer with a graphite monochromator and a Syntex LT-1 inert-gas (N_2) low-temperature delivery system. Data reduction was carried out as described by Riley & Davis (1976). Crystal and instrument stability were monitored by re-measurement of four check reflections after every 96 reflections. As detailed by Henslee & Davis (1975), these data were analyzed to relate intensity to exposure time by the equation $y = 1.0 + sx + tx^2$ where x is exposure time (h), y is fractional intensity relative to $x = 0$ and s and t are coefficients determined by least-squares fit. (c) Function minimized was $\sum w(F_o - F_c)^2$, where $w = \sigma_F^{-2}$, $\sigma_F = F\sigma_I/2I$, and $\sigma_I = [N_{pk} + N_{bg1} + N_{bg2} + (pI)^2]^{1/2}$.

Stereochemical Studies of Oligomers. XVI.* 2,3-Butanediyl Bis(*m*-chlorobenzoate)

BY GABRIELE BOCELLI

Centro di Studio per la Strutturistica Diffrattometrica del CNR, Via M. D'Azeglio 85, 43100 Parma, Italy

AND MARIE-FLORENCE GRENIER-LOUSTALOT

Institut Universitaire de Recherche Scientifique, ERA 895, Avenue Philippon, 6400 Pau, France

(Received 21 May 1985; accepted 30 October 1985)

Abstract. $C_{18}H_{16}Cl_2O_4$, $M_r = 367.2$, triclinic, $P\bar{1}$, $a = 8.327(3)$, $b = 7.874(2)$, $c = 7.645(3)$ Å, $\alpha = 61.89(4)$, $\beta = 91.46(3)$, $\gamma = 93.02(3)$ °, $V = 441.5(3)$ Å³, $Z = 1$, $D_x = 1.38$ g cm⁻³, $\lambda(Cu K\alpha) = 1.5418$ Å, $\mu = 35.23$ cm⁻¹, $F(000) = 190$, room temperature, $R = 0.059$ for 983 observed reflections. The conformation of the molecule is *trans* in the central part of the aliphatic chain while the rest differs noticeably from this arrangement, the C(7)–O(2)–C(8)–C(8') torsion angle being 149.9(4)°. The carboxylic groups are tilted by 12.2(2)° with respect to the aromatic ring planes. The two methyls are *trans* with respect to the C(8)–C(8') bond.

Experimental. Prismatic specimen 0.2 × 0.4 × 0.4 mm, lattice parameters refined by least squares by use of 19 $(\theta, \chi, \phi)_{hkl}$ accurate measurements on a Siemens AED single-crystal diffractometer on line to a General Automation Jumbo 220 computer. Intensities collected ($2 < \theta < 70$) with a modified version (Bellotti, Ugozzoli, Cantoni & Pasquinelli, 1979) of the Lehmann & Larsen (1974) procedure, one check reflection recorded every 50 counts, only statistical variation in intensity, 983 observed reflections [$I >$

$2\sigma(I)$] retained out of a total of 1486 measured independent reflections, $-10 \leq h \leq 10$, $-7 \leq k \leq 8$, $0 \leq l \leq 8$, data corrected for Lorentz and polarization effects but not for absorption. Direct methods with *MULTAN80* (Main, Fiske, Hull, Lessinger, Germain, Declercq & Woolfson, 1980), atomic coordinates of heavy atoms refined by full-matrix least squares first with isotropic temperature factors and then with anisotropic ones using *SHELX76* (Sheldrick, 1976), H atoms found in a difference Fourier map and refined isotropically; $R = 0.059$ and $wR = 0.061$ where $w = 0.3972/(\sigma^2 F + 0.02812F^2)$, $\sum w(F_o - F_c)^2$ minimized, final difference electron density map did not show peaks >0.26 e Å⁻³, $(\Delta/\sigma)_{\max} = 0.288$, scattering factors those of *SHELX*.

All calculations performed on a Gould Sel 32/77 computer.†

Table 1 gives the atom parameters and Table 2 bond lengths, angles and selected torsion angles. Fig. 1 shows the molecule and numbering scheme.
