## Stereochemical Studies of Oligomers. XVII.\* Dibenzyl Phthalate

BY GABRIELE BOCELLI

Centro di Studio per la Strutturistica Diffrattometrica del CNR, Via M. D'Azeglio 85, 43100 Parma, Italy

AND MARIE-FLORENCE GRENIER-LOUSTALOT

Institut Universitaire de Recherche Scientifique, ERA 895, Avenue Philippon, 6400 Pau, France

(Received 28 May 1985; accepted 30 October 1985)

**Abstract.**  $C_{22}H_{18}O_4$ ,  $M_r = 346.4$ , orthorhombic,  $P2_12_12_1$ ,  $a = 15.731 (3)$ ,  $b = 10.932 (3)$ ,  $c = 10.646 (2)$   $\text{\AA}$ ,  $V = 1830.8 (7)$   $\text{\AA}^3$ ,  $Z = 4$ ,  $D_x = 1.26 \text{ g cm}^{-3}$ ,  $\lambda(\text{Cu } K\alpha) = 1.5418 \text{ \AA}$ ,  $\mu = 6.63 \text{ cm}^{-1}$ ,  $F(000) = 728$ , room temperature,  $R = 0.063$  for 1301

\* Part XVI: Bocelli & Grenier-Loustalot (1986).

observed reflections. The molecule contains five planar parts: the three aromatic rings and the two carboxylic groups. These last two planar fragments are tilted by  $57.7 (2)$  and  $115.4 (2)^\circ$  with respect to the central aromatic ring respectively and form dihedral angles of  $108.1 (3)$  and  $85.0 (2)^\circ$  with respect to their respective terminal rings. In their turn, the planes of these last

## DIBENZYL PHTHALATE

rings form a dihedral angle of 116.3 (2)° to each other. Finally the dihedral angles formed by the central ring plane with the aromatic rings are 108.4 (3) and 38.8 (2)° respectively. The O(1) and O(3) atoms are *cis* with respect to the central ring.

**Experimental.** Crystals recrystallized from a 1:1 cyclohexane:methanol mixture, one crystal, cut from a larger one, approximately a prism 0.4 × 0.6 × 0.8 mm, used for data collection; Siemens AED single-crystal diffractometer equipped with a General Automation Jumbo 220 computer using Ni-filtered Cu K $\alpha$  radiation. All data measured using a local version (Belletti, Ugozzoli, Cantoni & Pasquinelli, 1979) of the Lehmann & Larsen (1974) method,  $2 \leq \theta \leq 70$ °, a standard reflection, measured every 50 counts, did not show any decrease in intensity, corrections for Lorentz and polarization effects, absorption ignored. A total of 1999 unique reflections collected,  $0 \leq h \leq 18$ ,  $0 \leq k \leq 12$ ,  $0 \leq l \leq 12$ , 1305 considered observed at  $2\sigma(I)$  level, preliminary cell dimensions determined by least squares for angular values of 21 reflections accurately measured on the diffractometer, structure solved by direct methods and refined by block-matrix least squares with *SHELX76* (Sheldrick, 1976), first with isotropic temperature factors and then with anisotropic ones, most H atoms located in a difference Fourier map, two put in their theoretical position and all refined isotropically. Four reflections, probably affected by extinction, omitted in last cycles, final  $R = 0.063$  and

$wR = 0.068$  with  $w = 1.0/(\sigma^2 F + 0.02136 F^2)$ ,  $\sum w(\Delta F)^2$  minimized, maximum peak in final  $\Delta F$  map = 0.23 e Å<sup>-3</sup>,  $(\Delta/\sigma)_{\text{max}} = 0.506$ , scattering factors of *SHELX*.

## Structure of a Milbemycin $\beta_3$ Intermediate

BY CAROLYN PRATT BROCK

Department of Chemistry, Northwestern University, Evanston, IL 60201, USA\*

(Received 12 June 1985; accepted 27 September 1985)

**Abstract.** (2S,4R,6S,8R,9S)-Methyl 8,9-dimethyl-4-(*tert*-butyl)diphenylsilyloxy)-1,7-dioxaspiro[5,5]-undecane-2-carboxylate.  $C_{29}H_{40}O_5Si$ ,  $M_r = 496.7$ , orthorhombic,  $P2_12_12_1$ ,  $a = 9.901$  (1),  $b = 9.964$  (2),  $c = 28.306$  (3) Å,  $V = 2792.5$  (9) Å<sup>3</sup>,  $Z = 4$ ,  $D_x = 1.182$  g cm<sup>-3</sup>, Mo  $K\alpha$  (graphite monochromator),  $\lambda = 0.71073$  Å,  $\mu = 1.134$  cm<sup>-1</sup>,  $F(000) = 1072$ ,  $T = 163$  (2) K,  $R = 0.030$  for 476 variables and 2726 unique reflections having  $I > 3\sigma(I)$ . The structure confirms the expected stereochemistry at C(2) and C(4) of this product, which is an intermediate on the route to the total synthesis of milbemycin  $\beta_3$ . There are no unusual bond distances or angles.

**Experimental.** A large, rather flat crystal (Attwood, Barrett, Carr, Finch & Richardson, 1985) grown from an ethyl ether/hexane solution was cut to give an approximate cube, 0.4 mm on a side. Data collected on an Enraf-Nonius CAD-4F diffractometer using  $\omega$  scans; 22 reflections having  $12.0 \leq \theta \leq 14.5^\circ$  used to determine lattice parameters; empirical absorption correction with factors 0.942-0.998;  $\theta \leq 27.5^\circ$ ; octant of data with  $0 \leq h \leq 12$ ,  $0 \leq k \leq 12$ ,  $0 \leq l \leq 36$ ; average

intensity loss for 3 control reflections of 2.3% overall (corrected); 3613 unique reflections measured; 2726 data having  $I > 3\sigma(I)$  used for refinement; structure solved using direct methods; absolute chirality assigned on basis of synthetic pathway; H atoms located in difference Fourier maps and refined isotropically; 476 variables; refinement on  $F$  magnitudes;  $R$ ,  $wR = 0.030$ , 0.037; error in an observation of unit weight = 1.29;  $w = 4I/[\sigma^2(I)]$  where  $[\sigma^2(I)]$  includes a term  $(0.04I)^2$ ; max.  $\Delta/\sigma$  in last cycle of 0.11; largest peak in final difference Fourier synthesis has height 0.20 e Å<sup>-3</sup> (top 10 peaks can be identified with bonding electron density); computer programs from the *Enraf-Nonius Structure Determination Package* (1982); scattering factors from Cromer & Waber (1974).

The molecular structure and the atom-numbering scheme are shown in Fig. 1; the crystal packing is displayed in Fig. 2. Atomic coordinates are listed in Table 1, and bond lengths and angles are given in Table 2.†
