angle between them, $94^{\circ}$, is in the reported range of other $\mathrm{Ph}_{2} \mathrm{P}-R-\mathrm{PPh}_{2}$ ligands $\left[73.5-107 \cdot 6^{\circ}\right.$ for $R$ $=-\left(\mathrm{CH}_{2}\right)_{2}-\$ though wider than that reported for $\left\{\mathrm{Rh}_{2}\left\{\mathrm{Ph}_{2} \mathrm{P}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{PPh}_{2}\right\}\left(\eta-\mathrm{C}_{5} \mathrm{H}_{5}\right)_{2}(\mathrm{CO})_{2}\right] \quad\left(70 \cdot 2^{\circ}\right)$. The $(\mathrm{Ph}) \mathrm{C}-\mathrm{C}(\mathrm{Ph})$ distances are in the range 1.351 (8)1.399 (8) $\AA$ with mean value of $1.380 \AA$. (Ph)C-$\mathrm{C}(\mathrm{Ph})-\mathrm{C}(\mathrm{Ph})$ angles are in the range $117.7(5)-$ $121.6(5)^{\circ}$ with the angle centered on C atoms bonded to $\mathrm{P}\left\{117.7(5)^{\circ}\right\}$ presenting its usual characteristic of being less than $120^{\circ}$ (Rivera, Rodulfo de Gil \& Fontal, 1985).

The $(\mathrm{Bu}) \mathrm{C}-\mathrm{P}$ distance $[1.838$ (5) $\AA]$ can be considered identical to the two $(\mathrm{Ph}) \mathrm{C}-\mathrm{P}$ bonds $[1.829$ (5) and $1.839(5) \AA$ ].

The authors are grateful to the CDCH-ULA and CONICIT-Venezuela (grants C-81-77 and S1-1863)
for financial support and to the CEDEC-ULA for the allocated time.

# Structure of 3,3-Diphenyltetrahydrofuran 

By Beverly R. Vincent and T. Stanley Cameron*<br>Department of Chemistry, Dalhousie University, Halifax, Nova Scotia, Canada B3H 4J3

(Received 28 August 1987; accepted 21 September 1987)

#### Abstract

C}_{16} \mathrm{H}_{16} \mathrm{O}, M_{r}=224 \cdot 3\), monoclinic, $P 2_{1}, a$ $=9.252$ (3), $\quad b=7.060$ (5), $\quad c=10.246$ (3) $\AA, \quad \beta=$ $112.65(3)^{\circ}, \quad V=617.6(5) \AA^{3}, \quad Z=2, \quad D_{x}=$ $1.206 \mathrm{Mg} \mathrm{m}^{-3}, \lambda\left(\right.$ Мо $\left.K \alpha_{1}\right)=0.70926 \AA, \mu=0.39 \mathrm{~mm}^{-1}$, $F(000)=240, T=293 \mathrm{~K}, R=0.049$ for 1257 observed reflections. The phenyl-substituted carbon in the furan ring is above the plane formed by the other four members of the ring. The planes of the two phenyl rings meet at an angle of $77^{\circ}$ and make angles of 153 and $82^{\circ}$ with the best plane of the furan ring. The bis-benzylic $\mathrm{C}-\mathrm{C}$ bond forms an angle of $62^{\circ}$ with the plane of one of the phenyl rings.

Introduction. The interest in the structure of 3,3diphenyltetrahydrofuran (I) arises from its photosensitized (electron-transfer) reaction (Arnold, Fahie, Lamont, Wierzchowski \& Young, 1987) using 1,4-dicyanobenzene as an electron-accepting photosensitizer and acetonitrile-methanol as solvent. The radical cation of (I) should be able to attain a conformation which would allow sufficient overlap of the SOMO, associated primarily with the diphenylmethyl moiety, with the $\sigma$-orbital of the benzylic $\mathrm{C}-\mathrm{C}$ bond so that cleavage will occur. The objective of the present X-ray structure

[^0]0108-2701/88/020279-03\$03.00
analysis is to determine the preferred conformation of (I) in the solid state in order to determine the potential for orbital overlap.

SHELX76 (Sheldrick, 1976). An $E$ map calculated from the set of phases with the highest figure of merit revealed a distorted phenyl ring. Fourier synthesis revealed in stages first the furan ring and finally the second phenyl ring. Origin in polar space group fixed by holding $y$ value of $\mathrm{C}(11)$ constant. Anisotropic temperature factors for C and O atoms, isotropic for $\mathrm{H} . \mathrm{H}$ positions from difference Fourier map calculated at $R=0.105$. Full-matrix least squares, refined on $F$. $\mathrm{C}-\mathrm{H}$ geometry fixed during refinement to ensure convergence ( $\mathrm{C}-\mathrm{H}$ bond lengths held to $1.08 \AA$ ). $w=\left[\sigma^{2}\left(F_{o}\right)+0.0003 F_{o}{ }^{2}\right]^{-1}$, final $R=0.049, w R=$ 0.049 for 1257 observed reflections and 218 leastsquares parameters, $R=0.072$ for all 1558 reflections; $(\Delta / \sigma)_{\max }=0.44$, final difference Fourier map featureless, with maximum and minimum peaks of 0.22 and -0.15 e $\AA^{-3} .020$ and 120 reflections suppressed owing to suspected secondary-extinction effects. Scattering
factors as in SHELX76. Calculations performed on a Perkin-Elmer 3230 computer.

Discussion. Final atomic parameters are in Table 1.* Bond lengths and angles are given in Table 2. A stereoview of the molecule is shown in Fig. 1 with the atom labelling indicated. The packing diagram, projected down the unique $b$ axis, is shown in Fig. 2.

The furan ring is non-planar, with the disubstituted $C(1)$ lying 0.7 (1) $\AA$ above the plane defined by $\mathrm{C}(2)-\mathrm{C}(3)-\mathrm{O}(4)-\mathrm{C}(5)$. The two phenyl rings are planar, with average deviations from planarity of 0.01 (2) $\AA . C(1)$ lies in the planes of both phenyl rings, which meet at an angle of $77(1)^{\circ}$. The plane of phenyl ring $1[C(11)$ to $C(16)]$ meets the best plane through the furan ring at an angle of 153 (1) ${ }^{\circ}$ while phenyl ring 2 meets the furan plane at an angle of $82(1)^{\circ}$. All C-C bonds in the phenyl rings are between 1.347 (8) and 1.402 (8) $\AA$ and internal angles lie between 116.9 and $122.9^{\circ}$.

The two $\mathrm{C}-\mathrm{O}$ bonds in the furan ring are the same $[C(3)-O(4): 1.428(5) ; O(4)-C(5): 1.418(6) \AA]$ as

* Lists of structure factors, anisotropic thermal parameters and H -atom parameters have been deposited with the British Library Document Supply Centre as Supplementary Publication No. SUP 44387 ( 16 pp.). Copies may be obtained through The Executive Secretary, International Union of Crystallography, 5 Abbey Square, Chester CH1 2HU, England.

Fig. 1. Stereoview of the title molecule.

Fig. 2. Packing diagram viewed down $b$ axis.
are the two $\mathrm{C}-\mathrm{C}$ bonds involving the phenyl-substituted $\quad C(1) \quad[C(1)-C(2): 1.545(6) ; \quad C(1)-C(5):$ 1.549 (5) $\AA$ |. However, the third $\mathrm{C}-\mathrm{C}$ bond in the furan ring, $\mathrm{C}(2)-\mathrm{C}(3)$, is considerably shorter than this at $1.497(6) \AA$. The angles within the ring range from a low of $96.2(4)^{\circ}$ at $C(1)$ to a high of $108 \cdot 1(4)^{\circ}$ at the oxygen.

These values are fairly typical of substituted furans, where disubstitution of any moiety at a carbon center tends to decrease the angle at that carbon. In $\alpha$-2-ethyl-5-methyl-3,3-diphenyltetrahydrofuran (Singh \& Ahmed, 1969), the angle at the phenyl-disubstituted carbon is slightly larger than that reported here, $99.4(2)^{\circ}$, while the angle at the oxygen is also larger, $110.8(2)^{\circ}$. However, the two $\mathrm{C}-\mathrm{O}$ bonds in that structure, while equivalent, are considerably longer than those found in (I), averaging 1.445 (4) $\AA$. The $\mathrm{C}-\mathrm{C}$ bond not involving the phenyl-substituted carbon in that compound is also significantly shorter than the others in the furan ring.

The small value of the bond angle inside the furan ring at $C(1)$ is consistent with other disubstituted carbon atoms in furan rings, and is not limited to those with bulky substituents. The angles at the substituted carbons in 3,3,4,4-tetrahydrofurantetrol (Mighell \& Jacobson, 1964) are $6^{\circ}$ smaller than those at the other two carbon centers in the ring, and $10^{\circ}$ smaller than the angle at the O atom. These angles, at $100 \cdot 3(3)^{\circ}$, are slightly larger than in phenyl-substituted furans.

The angle at the oxygen atom tends to be larger than the four internal carbon angles in similar compounds.

In 2,3,3,4,4,5-hexamethoxytetrahydrofuran (Iten, Weber \& Eugster, 1976) the $\mathrm{C}-\mathrm{O}-\mathrm{C}$ angle is $112 \cdot 6^{\circ}$, $7^{\circ}$ larger than any of the $\mathrm{O}-\mathrm{C}-\mathrm{C}$ or $\mathrm{C}-\mathrm{C}-\mathrm{C}$ angles. Similarly, in ( $2 S, 4 R, 5 R$ )-2-carboxymethyl-5-carboxy-2,4,5-trimethyl-2,3,4,5-tetrahydrofuran (Kirfel, Will, Wiedenfeld \& Roeder, 1980), the $\mathrm{C}-\mathrm{O}-\mathrm{C}$ angle is $5.3^{\circ}$ larger than all other internal ring angles.

There are no unusually close non-bonded contacts between molecules of (I).

The authors are grateful for financial support in the form of NSERC operating and infrastructure grants to TSC, an NSERC graduate research fellowship (19831987), a Sumner fellowship (1986-1987) and an Izaak Walton Killam predoctoral fellowship (1984-1987) to BRV.
