

In (IV), however, the C4 substituent is hydroxy and the angle spreading found in (I) and (II) has all but vanished. These differences are probably less the result of the steric properties of the O-methyl substituents in (I) and (II) than of the intramolecular H...O5 link observed in (IV). In (I), for example, the O4...O5 distance of 2.810 (3) Å is close to the usual 2.8 Å O...O contact distance, whereas the corresponding 2.56 (1) Å value in (IV) is substantially shorter.

The crystal packing is ordinary. There are no intermolecular contacts less than the sum of the appropriate van der Waals radii.

Abstract. 3'-Meo-salTPA, systematic name 2-[2-(1*H*-indol-3-yl)ethyliminomethyl]-6-methoxyphenol, $C_{18}H_{18}N_2O_2$, $M_r = 294.34$, triclinic, $P\bar{1}$, $a = 11.932$ (2), $b = 11.590$ (3), $c = 11.401$ (4) Å, $\alpha = 89.94$ (2), $\beta = 101.44$ (2), $\gamma = 101.24$ (2)°, $V = 1514$ (1) Å³, $Z = 4$, $D_x = 1.29$ Mg m⁻³, $F(000) = 592$, $\lambda(Mo K\alpha) = 0.71069$ Å, $\mu = 0.44$ mm⁻¹, final $R = 0.0962$, $wR = 0.1174$ for 1490 observed reflections. OHAPH-TPA, systematic name 2-[1-[2-(1*H*-indol-3-yl)ethylimino]ethyl]phenol, $C_{18}H_{18}N_2O$, $M_r = 278.36$, monoclinic,

$P2_1/a$, $a = 10.018$ (2), $b = 14.669$ (4), $c = 10.015$ (2) Å, $\beta = 90.54$ (2)°, $V = 1472$ (1) Å³, $Z = 4$, $D_x = 1.26$, $D_m = 1.29$ Mg m⁻³, $F(000) = 624$, $\lambda(Mo K\alpha) = 0.71069$ Å, $\mu = 0.44$ mm⁻¹, final $R = 0.0597$ for 1809 observed reflections. The two structures are compared and some structural features are emphasized. The C7A–C8A bond length for both compounds is shorter than a normal aromatic C–C bond. Both structures also show intramolecular and intermolecular hydrogen bonds, the first between the phenolic H and the N of the imino group and the second between the indolic N–H and the phenolic O of the other molecule.

Introduction. Tryptamine (*1H*-indole-3-ethanamine) is able to condense aromatic carbonyl compounds as previously described (Rodriguez, Medina de la Rosa, Gili, Martin Zarza, Martin Reyes, Medina & Diaz González, 1987). In this work we have examined the crystal structures of the products obtained for the first time by condensation of tryptamine with 3-methoxy-salicylaldehyde and with *ortho*-hydroxyacetophenone. The compounds obtained are respectively 3'-Meo-salTPA and OHAPH-TPA. These compounds are ligands that form complexes with transition metals (Martin Reyes, Gili, Martin Zarza, Medina Ortega & Diaz González, 1986) and the structures are compared with those of similar compounds previously described.

Experimental. 3'-Meo-salTPA was obtained as a yellow precipitate upon mixing and refluxing ethanol solutions of tryptamine and 3-methoxysalicylaldehyde. After filtering and washing with ethanol, the compound was recrystallized from ethanol. Yellow prismatic crystals, crystal *ca* $0.15 \times 0.16 \times 0.30$ mm, cell parameters by least squares from the setting angles of 15 reflections ($10 < 2\theta < 25^\circ$); 5336 independent reflections measured, ω scan up to $2\theta = 50^\circ$. One standard reflection measured every 50 reflections showed only random deviation from its mean intensity. 1809 reflections with $I \geq 2.5\sigma(I)$ were considered observed and included in the refinement; index range $h -12, +11; k -13, +13; l 0, +13$. $\sum w(\Delta F)^2$ minimized, anisotropic thermal parameters for non-H atoms. H positions determined by difference Fourier synthesis, refined with an overall isotropic temperature factor. Final $R = 0.0505$ and $wR = 0.0597$, $w = [\sigma^2(F) + 0.009202F^2]^{-1}$; max. and min. electron densities in final difference map $0.17, -0.21 \text{ e } \text{\AA}^{-3}$.

OHAPH-TPA was obtained in a similar manner by mixing and refluxing equimolar ethanol solutions of tryptamine and *ortho*-hydroxyacetophenone. Yellow prismatic crystals of OHAPH-TPA were obtained by recrystallization from ethanol. Unit-cell parameters were determined by a least-squares analysis of 2θ values for 15 reflections ($10 < 2\theta < 25^\circ$) measured with the diffractometer from a crystal *ca* $0.20 \times 0.15 \times 0.25$ mm. Intensity measurements were made for 2585 independent reflections of which 1490 were considered observed with $I \geq 2.5\sigma(I)$ and included in the refinement. Index range $h -11, +11; k 0, +17; l 0, +11$. ω scans up to $2\theta = 50^\circ$. One standard reflection measured every 50 reflections showed only random deviation from its mean intensity. $\sum w(\Delta F)^2$ minimized, anisotropic thermal parameters for non-H atoms. H positions determined by difference Fourier synthesis, refined with an overall isotropic temperature factor. Final $R = 0.0962$ and $wR = 0.1174$, $w = 2.6399 \times [\sigma^2(F) + 0.002198F^2]^{-1}$. Max. and min. electron densities in final difference map $0.46, -0.37 \text{ e } \text{\AA}^{-3}$. The high value of R is due to the poor quality of the single crystal.

For both compounds intensity data were measured with an automated Philips PW1100 four-circle computer-controlled diffractometer; graphite-monochromated Mo $K\alpha$ radiation, $\lambda = 0.71069 \text{ \AA}$, was used. Lorentz and polarization but not absorption corrections were made. The structures were solved by direct methods (Main, Fiske, Hull, Lessinger, Germain, Declercq & Woolfson, 1980) and Fourier synthesis (Stewart, Kundell & Baldwin, 1970). Torsion angles, planes and dihedral angles were calculated by the PARST program (Nardelli, 1982). Scattering factors from *International Tables for X-ray Crystallography* (1974). Least-squares refinement with SHELX76 (Sheldrick, 1976). The experimental densities were determined by pycnometry.

Discussion. Table 1 lists the final atomic parameters and their estimated standard deviations, following the numbering schemes of Figs. 1 and 2.* Table 2 gives bond angles and bond lengths. Selected torsion angles for both compounds are listed in Table 3. Stereoviews of the molecule are given in Figs. 3 and 4.

Some interesting structural data can be observed in these results; for example, the lengths of the C7A-C8A bond are $1.38(1)$ and $1.37(1) \text{ \AA}$ for 3'-Meo-salTPA and OHAPH-TPA, respectively, similar in both cases to that found for the compound salTPA [$1.36(1) \text{ \AA}$] (Rodriguez *et al.*, 1987) and are slightly shorter than the expected value for a normal aromatic C-C bond (1.395 \AA). This shortening of the bond has also been observed in tryptamine hydrochloride, a radiation protector (Wakahara, Fujiwara & Tomita, 1973).

The N12A-C13A bond corresponding to the imino group of 3'-Meo-salTPA and salTPA (Rodriguez *et al.*, 1987) is $1.27(1) \text{ \AA}$, similar to that found for OHAPH-TPA, and indicates a double bond for the $-\text{C}=\text{N}$ group.

The distance O20A-C19A for 3'-Meo-salTPA is $1.29(1) \text{ \AA}$, which is shorter than in the case of salTPA [$1.34(1) \text{ \AA}$] and indicates double-bond character for the C-O group. The value found for this same group in the case of OHAPH-TPA is $1.31(1) \text{ \AA}$, which is intermediate between values in 3'-Meo-salTPA and salTPA.

The N12A-C13A-C14A bond angle for 3'-Meo-salTPA is $123.6(6)^\circ$ while this same angle is $118.5(7)^\circ$ for OHAPH-TPA. This decrease can be explained by the steric impediment caused by the methyl group.

The majority of the torsion angles for 3'-Meo-salTPA are to be found between 0 and 180° as in the

* Lists of structure factors, anisotropic thermal parameters and H-atom parameters have been deposited with the British Library Document Supply Centre as Supplementary Publication No. SUP 44563 (19 pp.). Copies may be obtained through The Executive Secretary, International Union of Crystallography, 5 Abbey Square, Chester CH1 2HU, England.

case of salTPA (Rodriguez *et al.*, 1987). The C7A—C10A—C11A—N12A torsion angle is 60.2 (7)°, and the C7B—C10B—C11B—N12B torsion angle is −62.6 (7)°, indicating a synclinal disposition through the C10—C11 bonds (Klyne & Prelog, 1960). The indole groups of 3'-Meo-salTPA in molecules *A* and *B* form a dihedral angle of 90.0 (1)°.

$$B_{eq} = \frac{4}{3}\pi^2 \sum_i \sum_j U_{ij} a_i^* a_j^* \mathbf{a}_i \cdot \mathbf{a}_j$$

In OHAPH-TPA it is observed that the indole and phenol rings are to be found on different planes, forming a dihedral angle of approximately 70°. On the other hand, the system formed by the imino group (N12—C13), the oxygen (O21) and the phenyl group is not located on the same plane. The torsion angle for C7—C10—C11—N12 of OHAPH-TPA is 68.2 (9)°,

corresponding to a synclinal disposition through the C10—C11 bond, analogous to that found for 3'-Meo-salTPA.

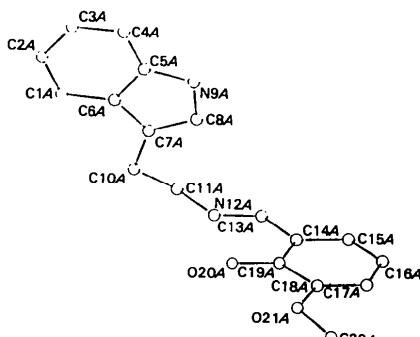

Fig. 1. View of the 3'-Meo-salTPA molecule.

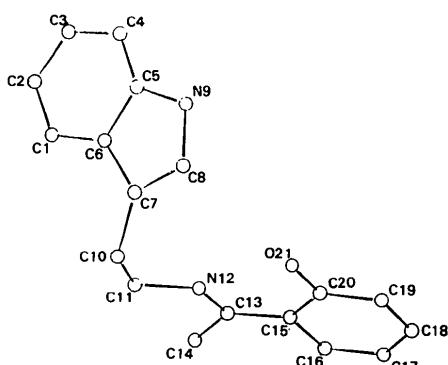

Fig. 2. View of the OHAPH-TPA molecule.

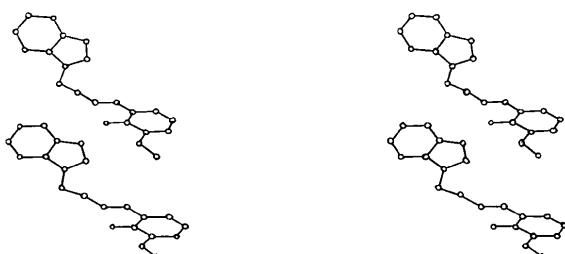

Fig. 3. A perspective view of the structure of 3'-Meo-salTPA.

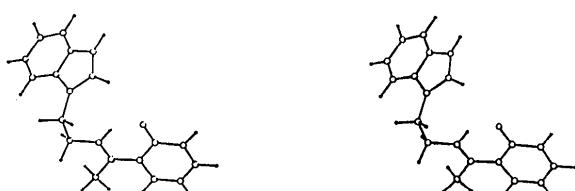

Fig. 4. View of the OHAPH-TPA molecule drawn with PLUTO (Motherwell & Clegg, 1978).

Table 3. Selected torsion angles ($^{\circ}$)

3'-Meo-salTPA			
C7A—C10A—C11A—N12A	+60.2 (7)	C11A—N12A—C13A—C14A	+176.4 (6)
C7B—C10B—C11B—N12B	-62.6 (7)	C11B—N12B—C13B—C14B	-178.2 (6)
C10A—C11A—N12A—C13A	-145.9 (6)	C8A—C7A—C10A—C11A	-12.2 (9)
C10B—C11B—N12B—C13B	+155.6 (6)	C8B—C7B—C10B—C11B	+12.0 (9)
OHAPH-TPA			
C7—C10—C11—N12	+68.2 (9)	C10—C11—N12—C13	+174.7 (7)
C11—N12—C13—C15	-174.6 (7)	C8—C7—C10—C11	-97 (1)

The sign convention used is that of Klyne & Prelog (1960).

An antiperiplanar disposition through the N12—C13 bond with a torsion angle of $-174.6 (7)^{\circ}$ is observed for the C11—N12—C13—C15 bond.

Finally, intra- and intermolecular hydrogen bonds are observed in both compounds. The first is to be found between the imino nitrogen and the phenolic oxygen, the N···H—O distances being 2.61 (8) Å for 3'-Meo-salTPA and 2.51 (1) Å for OHAPH-TPA. A value of 2.60 (2) Å was found for salTPA (Rodriguez *et al.*, 1987). The intermolecular hydrogen bond is established between the indolic nitrogen and the phenolic oxygen of another molecule, the N—H···O distance being 2.77 (1) Å for 3'-Meo-salTPA and 2.86 (1) Å for OHAPH-TPA. These intermolecular hydrogen bonds are responsible for the different orientation of one molecule with regard to the other in the elementary cell of both compounds.

PMZ is grateful to Gobierno Autonomo de Canarias and Caja General de Ahorros de Canarias for a research grant.
