

Fig. 1. Molecular structure and numbering scheme for tris-(2-pyridyl)phosphine. Hydrogen atoms are numbered according to the C atom to which they are bonded (Johnson, 1971).
reflections $\overline{5} 14, \overline{6} 14$ and $\overline{7} 14$ were excluded from the final refinement owing to poor agreement. At convergence $\quad R=0.046, \quad w R=0.056, \quad w=\left[\sigma^{2}(F)+\right.$ $\left.0.0028 F^{2}\right]^{-1}, \quad S=1.47,(\Delta / \sigma)_{\max } \leq 0.001, \quad(\Delta \rho)_{\text {max }}=$ $0.94,(\Delta \rho)_{\min }=-0.27$ e $\AA^{-3}$; no extinction correction. Scattering factors for all atoms given in SHELX76 (Sheldrick, 1976). All calculations on VAX11/785 computer system. Atomic parameters given in Table 1, bond distances and angles in Table 2;* the numbering scheme used is shown in Fig. 1.

Related literature. The title compound, (2-py) $\mathbf{P}$, has been shown by spectroscopic methods to function

[^0]primarily as a tridentate ligand through the three N donor atoms, e.g. $\left[M\left\{(2-\mathrm{py})_{3} \mathrm{P}\right\}_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ for $M=\mathrm{Mn}$, $\mathrm{Co}, \mathrm{Ni}, \mathrm{Cu}$ and Zn (Boggess \& Zatko, 1975), for $M=$ Co (Boggess \& Zatko, 1976; Hafeli \& Keene, 1987) and for $M=\mathrm{Fe}$ (Boggess, Hughes, Chew \& Kemper, 1981). However, both monodentate $\mathbf{P}$ and bidentate $\mathbf{P}, \mathbf{N}$ coordination have been reported for the (2-py) ${ }_{3} \mathrm{P}$ ligand in a series of Ru and Rh compounds, e.g. $\operatorname{RuHCl}\left\{(2-\mathrm{py})_{3} \mathrm{P}\right\}_{3}$ and $\mathrm{RhCl}\left\{(2-\mathrm{py})_{3} \mathrm{P}\right\}_{2}$ (Kurtev, Ribola, Jones, Cole-Hamilton \& Wilkinson, 1980). The only crystallographic characterization of a compound containing (2-py) $3_{3} \mathrm{P}$ is that for the $\left[\mathrm{Ru}\left\{(2-\mathrm{py})_{3} \mathrm{P}\right\}_{2}\right]^{2+}$ cation in which ( $2-\mathrm{py})_{3} \mathrm{P}$ adopts the more common tridentate mode of coordination (Stephenson, Keene, Snow \& Tiekink, 1988).

The Australian Research Grants Scheme is thanked for support.

# Propane-1,2,3-tricarboxylic Acid (Tricarballylic Acid) 

By John C. Barnes* and John D. Paton<br>Chemistry Department, The University, Dundee DD1 4HN, Scotland

(Received 7 October 1987; accepted 9 December 1987)

Abstract. $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{6}, M_{r}=176 \cdot 12$, orthorhombic, Pbca , $a=11.89$ (2), $\quad b=23.96$ (3), $\quad c=5.38$ (2) $\AA, \quad V=$ $1532.68 \AA^{3}, Z=8, \quad D_{x}=1.53 \mathrm{Mg} \mathrm{m}^{-3}, \lambda(\mathrm{Cu} K \alpha)=$ $1.5418 \AA, \mu=1.118 \mathrm{~mm}^{-1}, F(000)=736, T=293 \mathrm{~K}$, $R=0.062$ for 603 reflexions. The molecule has no

[^1]0108-2701/88/040758-03\$03.00
unusual bond lengths or angles. Molecules are linked into double sheets by hydrogen bonding similar to that found in citric acid although the molecular conformations are different.

Experimental. Colourless crystals from water, very few. of adequate diffraction quality. Preliminary © 1988 International Union of Crystallography

photographs indicated an orthorhombic system. Unitcell dimensions were refined from 0 kl and $h k 0$ Weissenberg photographs. Intensity data from equiinclination Weissenberg photographs of a crystal $0.5 \times 0.3 \times 0.1 \mathrm{~mm}$ mounted initially on a (layers 0,1 ) and subsequently on $c$ (layers $0-4$ ). Intensities were measured by the SERC Microdensitometer Service, Daresbury Laboratory. 2045 measured reflexions gave 603 unique data, $R_{\text {int }} 0.082$, all of which were used in the refinement. Range of indices $0 \leq h \leq 13,0 \leq$ $k \leq 27,0 \leq l \leq 6,2 \theta_{\text {max }} 139^{\circ}$. Data corrected for Lorentz and polarization terms but not for absorption. All calculations were performed on the Dundee University DEC 10 computer using the program packages SHELXS (Sheldrick, 1986), SHELX76 (Sheldrick, 1976), XANADU (Roberts \& Sheldrick, 1975) and PLUTO (Motherwell \& Clegg, 1978). Atomic scattering factors were taken from SHELX76.

The direct-methods routine $T R E F$ showed all the non-hydrogen atoms. The structure was refined by conventional least-squares procedures and difference
syntheses with isotropic and then anisotropic thermal parameters for the non-hydrogen atoms. Skeletal $(\mathrm{C}-\mathrm{H})$ hydrogen atoms were introduced in calculated positions using one refined overall isotropic thermal parameter $\left[U=0.039(9) \AA^{2}\right]$. The carboxylic-acid hydrogen atoms were located on difference syntheses and refined with a second overall isotropic thermal parameter $\left[U=0.078(18) \AA^{2}\right]$. Final refinement minimizing $\sum w\left|F_{o}-\left|F_{c}\right|\right|^{2}, 120$ refined parameters, $R=0.062, \quad w R=0.078, \quad w=6.3331 /\left[\sigma^{2}(F)+\right.$ $0.000186 F^{2}$, mean shift/e.s.d. $=0.007$, max. shift/ e.s.d. $=0.036, \quad \max . \quad \Delta \rho=0.34, \min . \quad \Delta \rho=$ -0.38 e $\AA^{-3}$.

Final coordinates are given in Table 1, with bond lengths and angles in Table 2.* The molecule is shown in perspective view in Fig. 1, molecular packing is illustrated in Fig. 2.

Related literature. Comparison with anhydrous citric acid (Glusker, Minkin \& Patterson, 1969), which differs only in the presence of a hydroxyl group on C2, shows a very similar pattern of hydrogen bonding (Fig. 2). The group $\mathrm{C} 4, \mathrm{O}, \mathrm{O}$ is linked to the same group of

another molecule across a centre of symmetry by two hydrogen bonds, and $\mathrm{C} 7, \mathrm{O}, \mathrm{O} 9$ is linked to $\mathrm{C} 10, \mathrm{O} 11$, O12 of a molecule related by a glide plane, again using two hydrogen bonds (Table 2). However, the conformations of tricarballylic and citric acids are quite different. Torsion angles are compared in Table 3.

Although the calcium salt occurs widely in vegetables such as sugar beet, few metal complexes of tricarballylic acid have been reported. These often have smaller solution formation constants than the corresponding citrates and precipitate as fine powders at relatively low pH (Barnes \& Bristow, 1969). Attempts in this laboratory to prepare single-crystal specimens of these complexes have not yet been successful.

(Received 22 October 1987; accepted 2 December 1987)

#### Abstract

C}_{16} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{10}, M_{r}=400 \cdot 35\), orthorhombic, $P 21_{1} 2_{1}, \quad a=11.581(1), \quad b=15.153(1), \quad c=$ 10.787 (1) $\AA, \quad V=1892.9 \AA^{3}, \quad Z=4, \quad D_{x}=$ $1.405 \mathrm{~g} \mathrm{~cm}^{-3}, \quad \lambda(\mathrm{Cu} K \alpha)=1.5418 \AA, \quad \mu=9.77 \mathrm{~cm}^{-1}$, $F(000)=840, T=298 \mathrm{~K}$, final $R=0.035$ for 1933 unique reflections $\left[F_{o}^{2}>2 \sigma\left(F_{o}^{2}\right)\right]$. Five-membered lactam ring of title compound is in the envelope form. The pyranose ring adopts a distorted ${ }^{1} C_{4}(D)$ chair conformation, contrary to the boat form [ $\left.B_{0,3}(D)\right]$ observed in solution.

Experimental. Colorless prisms of the title compound were grown from ethanol solution. Crystal size $0.30 \times$

[^3]0108-2701/88/040760-03\$03.00
$0.28 \times 0.13 \mathrm{~mm}$, Enraf-Nonius CAD-4 $\kappa$-cradle diffractometer, $\mathrm{Cu} K \alpha$ radiation, graphite monochromator, $\theta-2 \theta$ scan with scan speed $2.06-4.12^{\circ} \mathrm{min}^{-1}$ in $\theta$, scan width $(0 \cdot 50+0 \cdot 14 \tan \theta)^{\circ}$. Range of indices $0 \leq h \leq 14 ; 0 \leq k \leq 19,0 \leq l \leq 13\left(2 \theta<150^{\circ}\right)$. Lattice constants determined based on $252 \theta$ values ( $21<\theta<47^{\circ}$ ). Variation of standard $<1.5 \% ; 2223$ unique reflections measured; 1933 observed reflections with $F_{o}^{2}>2 \sigma\left(F_{o}^{2}\right)$. Systematic absences $h 00, h$ odd; $0 k 0$, $k$ odd; $00 l, l$ odd. No corrections for absorption. Structure solved by direct methods with MULTAN (Main, Woolfson \& Germain, 1971). Refined by full-matrix least squares. The locations of all the H atoms were found on a difference-Fourier map. Non-H atoms refined with anisotropic thermal parameters, and H atoms with isotropic thermal parameters $(B=$ $5.5 \AA^{2}$ : fixed). $\sum w\left(\left|F_{o}\right|-\left|F_{c}\right|\right)^{2}$ minimized; $w=1.0$ © 1988 International Union of Crystallography
