

Fig. 1. View of (1) showing the atom-numbering scheme.

M^{II} complexes ($M^{II} = \text{Ni}, \text{Cu}, \text{Zn}$) have been prepared (Fikar, Bharadwaj, Potenza & Schugar, unpublished results).

As indicated by the torsion angles and bond distances, the molecule shows approximate point symmetry 2 with the pseudo-diad axis normal to the S(2)–S(1) and C(5)–C(6) bond vectors. The C(1)–S(1)–S(2)–C(10) torsion angle in the ten-membered macrocycle ring is substantially larger than that found [52 (1) $^\circ$ (Cheng & Nyburg, 1978)] in the six-membered ring of an oxadithiin derivative and lies within the range observed [78.6 to 101 $^\circ$ (Rout, Seshasayee, Subrahmanyam & Aravamudan, 1983)] for several acyclic and presumably unstrained disulfides. Both imino groups are *trans* substituted [C(8)–N(2)–C(9)–C(10), –172.6 (2) $^\circ$; C(3)–N(1)–C(2)–C(1),

–173.7 (2) $^\circ$] as is the cyclohexane ring which has the stable chair conformation. The N(1)–C(3)–C(8)–N(2) torsion angle [–63.1 (2) $^\circ$] is substantially larger than those reported for protonated [–58.5, 58.3 $^\circ$ (Morse & Chesick, 1976)] or chelated [53.8, 52.8 $^\circ$ (Sato & Saito, 1977)] 1,2-*trans*-diaminocyclohexane, possibly as a result of constraints imposed by the ten-membered ring. Other structural parameters of the cyclohexane ring, including the C–C–C–C torsion angles, are typical.

We thank the National Science Foundation for support of research (Grant 84-17548) and the National Institutes of Health for an instrumentation grant (Grant 1510 RRO 1486 01A1).

1-*p*-Menthene-3,6-diol, a Monoterpene

BY TERRY J. DELORD, ARCELIO J. MALCOLM, FRANK R. FRONCZEK, NIKOLAUS H. FISCHER AND STEVEN F. WATKINS

Department of Chemistry, Louisiana State University, Baton Rouge, Louisiana 70803–1804, USA

(Received 29 October 1987; accepted 17 December 1987)

Abstract. $\text{C}_{10}\text{H}_{18}\text{O}_2$, $M_r = 170.25$, monoclinic, $C2$, $a = 17.837 (4)$, $b = 7.113 (7)$, $c = 8.096 (2) \text{ \AA}$, $\beta = 102.17 (6)^\circ$, $V = 1004 (2) \text{ \AA}^3$, $Z = 4$, $D_x = 1.13 \text{ g cm}^{-3}$, $\lambda(\text{Mo } K\alpha) = 0.71073 \text{ \AA}$, $\mu = 0.7 \text{ cm}^{-1}$, $F(000) = 376$, $T = 297 \text{ K}$, $R = 0.036$ for 973 reflections with $I > 2.5\sigma(I)$ (1218 unique). The cyclohexene ring itself is in the half-chair conformation, very close to twofold symmetry [$\Delta C_2 = 1.3 (2)^\circ$] with virtually no torsion [0.5 (3) $^\circ$] about the double bond. The two

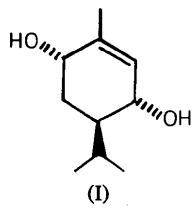

hydroxyl groups are oriented *syn* with respect to one another, *anti* with respect to the isopropyl group; each hydroxyl is in contact with opposite-number hydroxyls on two neighboring molecules [$\text{O} \cdots \text{O} = 2.691 (2)$, $2.728 (2) \text{ \AA}$], resulting in disordered hydrogen bonding.

Experimental. The title compound (I) was isolated from *Melampodium divaricatum* (Rich. in Pers.) DC. (Asteraceae) from Provincia de Alajuela, Costa Rica;

Table 1. Experimental details

Crystal	Colorless, 0.6 × 0.4 × 0.2 mm
Instrument	Enraf-Nonius CAD-4 diffractometer
Monochromator	Incident beam, graphite
Unit cell	25 reflections, $2\theta < 24^\circ$
Mode	$\omega-2\theta$
Standards	10,0,0, 020, 002; $\pm 3.6\%$ variation
R_{int}	0.026
Corrections	Background, Lorentz, polarization
2θ range	2–54°
hkl ranges	$h = 0$ to 22 $k = 0$ to 9 $l = -10$ to 10
Reflections	1291 total 1218 unique 245 unobserved 973 with $I > 2.5\sigma(I)$
Solution	Direct methods
Function minimized	$\sum w(F_o^2 - F_c)^2$
Weights	$4F_o^2 Lp^2 / [S^2(C + R^2B) + (0.04F_0^2)^2]$ $S = \text{scan rate}$, $C = \text{integrated count}$, $R = \text{scan time/background time}$, $B = \text{background count}$
Parameters refined	125
R , wR , $R(\text{all})$	0.036, 0.048, 0.057
Goodness of fit	1.91
Maximum shift/e.s.d.	0.01
$\Delta\rho$	0.14, –0.18 e Å ⁻³

collected on 3 July 1981 (C. Hasbun No. 313, voucher at Universidad Nacional Heredia, Costa Rica). A clear, colorless sample was cleaved from a larger prismatic crystal and mounted with epoxy on a glass fiber in random orientation. Details of data collection and structural refinement are given in Table 1.

Structure solved using MULTAN80 (Main, Fiske, Hull, Lessinger, Germain, Declercq & Woolfson, 1980); all 12 non-H atoms were located from an E map. Refinement by full-matrix least squares with Enraf-Nonius SDP (Frenz, 1978): non-H atoms anisotropic; all non-hydroxyl H atoms placed in computed positions with independent isotropic thermal parameters but riding C atoms to which they are attached; disordered half-H atoms located on both hydroxyl groups by ΔF syntheses, then adjusted for reasonable geometry to ride O atoms with fixed thermal parameters. The final cycle of refinement included 125 variable parameters and converged to $R = 0.036$. Atomic scattering factors from International Tables for X-ray Crystallography (1974). The absolute configuration was not determined.

Structure of 3'-Azido-3'-deoxythymidine, AZT

BY I. DYER, J. N. LOW AND P. TOLLIN

Carnegie Laboratory of Physics, University of Dundee, Dundee DD1 4HN, Scotland

H. R. WILSON

Department of Physics, University of Stirling, Stirling FK9 4LA, Scotland

AND R. ALAN HOWIE

Department of Chemistry, University of Aberdeen, Meston Walk, Old Aberdeen AB9 2UE, Scotland

(Received 4 November 1987; accepted 6 January 1988)

Abstract. $C_{10}H_{13}N_5O_4$, $M_r = 267.2$, monoclinic, $P2_1$, $a = 5.716$ (3), $b = 11.998$ (8), $c = 17.658$ (10) Å, $\beta = 94.26$ (4)°, $V = 1208$ Å³, $Z = 4$, $D_x = 1.47$ g cm⁻³, $\lambda(Mo K\alpha) = 0.71069$ Å, $\mu = 7.5$ cm⁻¹, $F(000) = 560$, $T = 293$ K. $R = 0.060$ for 2138 unique observed [$F > 4\sigma(F)$] reflections. The *N*-glycosidic torsion angles χ have values -125.9 (5) and -172.0 (5)°, in the *anti* range. (Molecule-*A* values are given first throughout.) The sugar puckers are $\frac{3}{2}T$ ($C3'$ -*exo/C2'*-*endo*), with $P = 171$ (1)° and $\psi_m = 14$ (1)°, and $\frac{3}{2}T$ ($C4'$ -*endo/C3'*-*exo*), with $P = 213$ (1)° and $\psi_m = 11$ (1)°. The C4–C5 conformations, with $\gamma = 49.7$ (5) and 173.7 (5)°, are +sc (*gauche-gauche*) and *ap* (*gauche-trans*). The conformational parameters used follow the guidelines of the IUPAC–IUB Joint Commission on Biochemical Nomenclature [*Pure Appl. Chem.* (1983), **55**, 1273–1280]. The molecules in the asymmetric unit form a hydrogen-bonded, base-paired dimer. The

bonding is as follows: N3*A*–0.973 Å–H3*A*…1.790 Å…O2*B*, N3*A*…O2*B* 2.747 (8) Å, angle at H3*A* 167° and N3*B*–0.992 Å–H3*B*…1.916 Å…O2*A*, N3*B*…O2*A* 2.894 (8) Å, angle at H3*B* 168°. The propeller twist between the bases is 5° [Wilson & Tollin (1987). *Nucleosides Nucleotides*, **6**, 643–653].

Experimental. Crystals were obtained from aqueous solution. Space group and initial cell dimensions were obtained from Weissenberg photographs. Data were collected on a Nicolet P3 (four-circle) diffractometer in Aberdeen by RAH. The crystal had dimensions 0.6 × 0.3 × 0.2 mm. Cell parameters were measured on the diffractometer using 14 reflections in the 2θ range 15–22°. Range of indices: $0 \leq h \leq 9$; $0 \leq k \leq 18$; $-26 \leq l \leq 26$. Data measured using $\theta/2\theta$ scans in the range $0 < 2\theta < 55$ °. Standard reflections, 253 and 106, were measured every 50 reflections. No
