two. We note that the conformations at the $\mathrm{C}(1)-\mathrm{C}(2)$, $\mathrm{C}(1)-\mathrm{C}(6)$ and $\mathrm{C}(1)-\mathrm{C}(12)$ bonds are similar which is different from the closely related $\alpha, \alpha$-bis $(p$-chloro-phenyl)-3-pyridinemethanol (parinol) (Kennard, Smith \& Palm, 1981). For clarity, Newman projections along the three bonds in fenarimol are shown in Fig. 2. While in parinol the two phenyl rings are nearly symmetrically oriented with respect to the heterocyclic ring plane, this is not the case in fenarimol.

Short H-bond interactions (Taylor \& Kennard, 1982) are intramolecular $\mathrm{Cl}(1) \cdots \mathrm{H}(\mathrm{O} 1)$ [2.37 (8) $\AA$ ] and intermolecular $\mathrm{O}(1) \cdots \mathrm{H}(\mathrm{C} 16)$ [2.48 (8) $\AA$ ] and $\mathrm{N}(2) \cdots \mathrm{H}(\mathrm{C} 5)[2.54(8) \AA]$; all other packing distances are in the normal range.

#### Abstract

C}_{17} \mathrm{H}_{20} \mathrm{O}_{9}, \quad M_{r}=368 \cdot 3\), triclinic, $P \overline{1}, a$ $=5.687$ (4), $\quad b=12.367$ (3), $\quad c=12.830$ (3) $\AA, \quad \alpha=$ 106.24 (2), $\quad \beta=92.34$ (5), $\quad \gamma=90.39(5)^{\circ}, \quad V=$ $865.5 \AA^{3}, \quad Z=2, \quad D_{x}=1.41 \mathrm{~g} \mathrm{~cm}^{-3}, \quad \lambda($ Mo $K \alpha)=$ $0.71073 \AA, \mu=0.73 \mathrm{~cm}^{-1}, F(000)=388, T=293 \mathrm{~K}$, final $R=0.091$ for 1482 observed $\left[F_{o} \geq 5 \sigma\left(F_{o}\right)\right]$ reflections. The observed structure confirms the stereochemistry as the all-trans isomer. There is no crystallographically imposed symmetry. High thermal motion was noted for one of the methoxycarbonyl groups, but a disorder model could not be developed.

Introduction. In the course of our work on the total synthesis of naturally occurring, antimitotic lignan lactones, we have determined the X-ray structure of the title compound. The assignment of substituent stereochemistry on a $\gamma$-lactone moiety by ${ }^{1} \mathrm{H}$ NMR coupling-

[^0]0108-2701/88/101784-03\$03.00
constant analysis is sometimes problematic. Vicinal hydrogen coupling constants for trans-substituted compounds have generally been larger than those of the cis isomer; however, several exceptions have been noted (Bystrom, Hogberg \& Norin, 1981; Fristad \& Peterson, 1985). The preparation of the title compound provided two isomers that we felt were simply epimeric at the 3-position due to ${ }^{1} \mathrm{H}$ NMR chemical shifts and coupling constants. As our projected conversion of this mixture to a cis-fused dicinnamic acid dilactone necessitated a trans disposition of the 4 -methoxycarbonyl and 5 -aryl groups, we felt compelled to establish firmly this stereorelationship for the major isomer at an early stage.

Experimental. Crystals (m.p. $380-382 \mathrm{~K}$ ) were obtained by slow evaporation of an ethyl acetatepetroleum ether solution of the title compound. The X-ray structure was in full agreement with IR, ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR and analytical data. The compound was © 1988 International Union of Crystallography

prepared by a procedure described elsewhere (Surjasasmita 1987; Peterson, Do \& Surjasasmita, 1988). $D_{m}$ not determined. Crystal $0.20 \times 0.25 \times 0.60 \mathrm{~mm}$.

Enraf-Nonius CAD-4 diffractometer, graphite-monochromated Mo Ka. Cell constants from setting angles of 25 reflections $\left(\theta>19^{\circ}\right)$. Correction for Lorentzpolarization effect, no correction for absorption. $\theta_{\text {max }}$ $=42^{\circ} ; h 0$ to $5, k-12$ to $12, l-12$ to 12 . Standard reflections measured every 3600 s of data collection time: 201, 070, 009. Variation $= \pm 2 \% .1836$ reflections measured, 1482 independent observed reflections $\left\{F_{o} \geq 5 \sigma\left(F_{o}\right)\right.$. Structure solved utilizing MULTAN (Germain, Main \& Woolfson, 1971) direct-methods program. Geometrically constrained H atoms were placed $0.95 \AA$ from the bonded C atom with a fixed isotropic thermal parameter $B=5.5 \AA^{2}$ and allowed to ride on that atom. High thermal motion was noted for $\mathrm{C}(13), \mathrm{C}(14), \mathrm{O}(5)$ and $\mathrm{O}(6)$ although it was most pronounced for $\mathrm{C}(14)$. A disorder model could not be developed considering the rigidity of this group, and the effect is most probably thermal in nature. The methyl H atoms, except those for C(14), were located from a difference Fourier map and included with fixed contributions ( $B=5 \cdot 5 \AA^{2}$ ). An unfortunate consequence of the high thermal motion and the inability to locate all H atoms for the title compound comprising only light atoms, is a rather high $R$ value of 0.091 . Scattering factors and anomalous-dispersion corrections from International Tables for X-ray Crystallography (1974); structure refined with SHELX76 (Sheldrick, 1976). $\sum w\left(\left|F_{o}\right|-\left|F_{c}\right|\right)^{2}$ minimized, weights $=$ unit, 235 parameters varied. $R=0.091, w R=0 \cdot 100, S=1.74$. $\Delta / \sigma$ in final least-squares refinement cycle $<0.01$, $\Delta \rho<0.4 \mathrm{e} \AA^{-3}$ in final difference map.

Discussion. Fractional coordinates and $B_{\text {eq }}$ values are given in Table 1,* distances and angles in Table 2. A

Fig. 1. Thermal-ellipsoid plot of the title compound showing the arbitrary atom-numbering scheme.
trans stereorelationship between the 4-methoxycarbonyl and 5-aryl groups has been confirmed as seen in the ORTEP drawing (Johnson, 1976), Fig. 1.

The lactone ring exists in an envelope conformation with atoms $\mathrm{O}(1), \mathrm{C}(1), \mathrm{C}(2)$ and $\mathrm{C}(4)$ planar to within $0.023 \AA$ and $C(3)$ out of this plane by $0.65 \AA$. The $\mathrm{O}(1)-\mathrm{C}(1)-\mathrm{C}(2)$ bond angle is $108.7(8)^{\circ}$, deviating somewhat from an unconstrained trigonal carbon center. The bond angles $C(2)-C(3)-C(4)$ and $C(1)-$ $\mathrm{C}(2)-\mathrm{C}(3)$ are 99.7 (7) and $101 \cdot 1$ (7) ${ }^{\circ}$, respectively, and in turn reflect angle compression due to ring size from that usually associated with aliphatic $s \dot{p}^{3}$-hybridized carbon. Bond distances are unaffected by ring geometry in this compound. The bond distance between $C(2)$ and $C(3)$ is $1.55(1) \AA$ and that between $C(3)$ and $\mathrm{C}(4)$ is $1.53(1) \AA$. The torsion angles $\mathrm{H}(1)[\mathrm{C}(3)]-$ $\mathrm{C}(3)-\mathrm{C}(4)-\mathrm{H}(1)[\mathrm{C}(4)]$ and $\mathrm{H}(1)[\mathrm{C}(2)]-\mathrm{C}(2)-\mathrm{C}(3)-$ $\mathrm{H}(1)[\mathrm{C}(3)]$ of -154.4 and $+151.0^{\circ}$, respectively, support an all-trans disposition of substituents at these centers, and are consistent with the relatively large ${ }^{1} \mathrm{H}$ NMR vicinal coupling constants (observed 8.72 and 10.62 Hz , respectively) associated with the major stereoisomer formed by our reaction procedure. The similarly large vicinal hydrogen coupling constant observed for $H(1)[C(4)]$ of the non-crystalline minor isomer is hence consistent with our initial structural assignment that these compounds are simply epimeric at the 3-position (Peterson et al., 1988). Finally, as anticipated, the aromatic ring atoms $\mathrm{C}(5)-\mathrm{C}(10)$ define a plane to within $0.011 \AA$.

The authors are greatly indebted to the American Cancer Society, Illinois Division, Inc. (JRP, grant No. 87-53), the Milheim Foundation for Cancer Research (JRP, grant No. 87-32), the Elsa U. Pardee Foundation (JRP), the Donors of the Petroleum Research Fund (JRP and RDR), administered by the American Chemical Society, and to the Northern Illinois University Graduate School and Biomedical Research Support Group (JRP) for their generous support of this research. The US National Science Foundation's Chemical Instrumentation Program provided funding to purchase the diffractometer.

final $R=0.047$ for 2733 observed $\left[F_{o} \geq 5 \sigma\left(F_{o}\right)\right]$ reflections. The observed structure reveals that the trans disposition of the substituents at positions 4 and 5 of the heterocycle is maintained in the reaction sequence, and that the major stereocomponent in the product mixture possesses a cis-3,4-bis(methoxycarbonyl) relationship. There is no crystallographically imposed symmetry.
