Structure of Ethyl 2-Amino-4,5,6,7-tetrahydrobenzo[*b*]thiophene-3-carboxylate at 163 K

BY S. B. LARSON* AND S. H. SIMONSEN

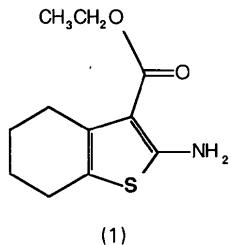

Department of Chemistry, University of Texas at Austin, Austin, TX 78712, USA

(Received 2 April 1987; accepted 27 June 1988)

Abstract. $C_{11}H_{15}NO_2S$, $M_r = 225.31$, monoclinic, $P2_1/c$, $a = 8.2996$ (13), $b = 9.5307$ (12), $c = 14.6009$ (20) Å, $\beta = 105.818$ (13)°, $V = 1111.2$ (3) Å³, $Z = 4$, D_x (163 K) = 1.347, D_m (295 K) = 1.310 (1) g cm⁻³, $\lambda(MoK\alpha) = 0.71069$ Å, $\mu = 2.68$ cm⁻¹, $F(000) = 480$, $R = 0.0407$ for 2527 reflections [$F_o \geq 4\sigma(F_o)$]. The thiophene ring is planar [max. deviation: C(9), 0.007 (2) Å] as is the carboxyl group, C(3),C(10),O(1),O(2) [max. deviation: C(10), 0.001 (2) Å]; the twist between these planes is only 0.96 (7)°. Planarity of the N,C(2),C(3),C(10),O(1),O(2),C(11) fragment is favored because of the intramolecular hydrogen bond [O(1)…H(N)B, 2.08 (3) Å]; and conjugation which is evident in the short single bonds [C(2)–N and C(3)–C(10)] and long double bonds [C(2)–C(3) and C(10)–O(1)] in this fragment. The N is slightly pyramidal [max. deviation: N, -0.105 (2) Å]. The intermolecular hydrogen bonding [O(1)…H(N)A ($1-x, \frac{1}{2}+y, \frac{1}{2}-z$), 2.01 (2) Å] connects the molecules along the b axis. All other intermolecular contacts are not less than the sum of the respective van der Waals radii.

Experimental. Large colorless, transparent prismatic crystals of (1) were obtained by sublimation from a

sample purchased from Aldrich Chemical Co. Density was measured by flotation in aqueous ZnCl₂. Table 1 is a summary of data collection and structural refinement.

The structure was solved by MULTAN78 (Main, Hull, Lessinger, Germain, Declercq & Woolfson, 1978), and refined by full-matrix least squares (SHELX76, Sheldrick, 1976). Scattering factors and anomalous-dispersion corrections for non-H atoms were taken from International Tables for X-ray Crystallography (1974); H from Stewart, Davidson & Simpson (1965). All atomic positional parameters were refined. Non-H atoms were refined anisotropically; H atoms isotropically. The H atoms were located in an electron density difference map as peaks of 0.60–0.94 e Å⁻³. Atom labeling, bond lengths and bond angles are shown in Fig. 1. Fig. 2 illustrates the molecular packing and

Table 1. Summary of data collection and structural refinement for C₁₁H₁₅NO₂S

| | |
|---|---|
| (a) Data collection (163 K)*† | |
| Radiation, λ (Å) | Mo $K\alpha$, 0.71069 |
| Mode | ω scan |
| Scan range | Symmetrically over 1° about $Ka_{1,2}$ maximum |
| Background | Offset $\pm 1^\circ$ in ω from $Ka_{1,2}$ maximum |
| Scan rate ($^\circ$ min $^{-1}$) | 3.0–6.0 |
| Stability analysis | |
| Computed s, I | -0.000171, 0.0 |
| Correction range on I | 0.4% (not applied) |
| Standard reflections | 004, 020, 210, 213 |
| 2θ range ($^\circ$) | 4.0–60.0 |
| Total reflections measured, unique | 3250, 3250 |
| Crystal dimensions (mm) | 0.46 \times 0.31 \times 0.14 |
| Crystal volume (mm 3) | 0.0185 |
| Crystal faces | (011), (011), (011), (021), {100}, {111}, (111), (001) + fragment face |
| Transmission-factor range | 0.923–0.968 |
| | |
| (b) Structure refinement‡ | |
| Instability factor, p | 0.04 |
| Reflections used, m [$F \geq 4\sigma(F_0)$] | 2527 |
| No. of variables, n | 196 |
| Goodness of fit, S | 1.307 |
| R, wR | 0.0407, 0.0458 |
| R_{all} | 0.0573 |
| Max. d/σ | 0.017 |
| Max. peak in difference map ($e \text{ \AA}^{-3}$) | 0.35 [near C(5), disordered] |
| Min. density in difference map ($e \text{ \AA}^{-3}$) | -0.29 |

* Unit-cell parameters were obtained by least-squares refinement of the setting angles of 45 reflections with $21.6^\circ < 2\theta < 27.8^\circ$.

[†] Syntex P2₁ diffractometer with a graphite monochromator and Syntex LT-1 inert-gas (N_2) low-temperature delivery system. Data reduction was carried out as described in Riley & Davis (1976). Crystal and instrument stability were monitored by remeasurement of 4 check reflections after every 96 reflections. As detailed by Henslee & Davis (1975), these data were analyzed to relate intensity to exposure time by the equation $y = 1.0 + sx + tx^2$, where x is exposure time (hours), y is fractional intensity relative to $x = 0$ and s and t are coefficients determined by least squares.

\pm Function minimized was $\sum w(|F_0| - |F_1|)^2$, where $w = 1/(\sigma(F_0))^2$; $\sigma(F_0) = \{F_0[\sigma(I)]\}/2I$; $\sigma(I) = [N_{pk} + N_{bg1} + N_{bg2} + (pI)^2]^{1/2}$.

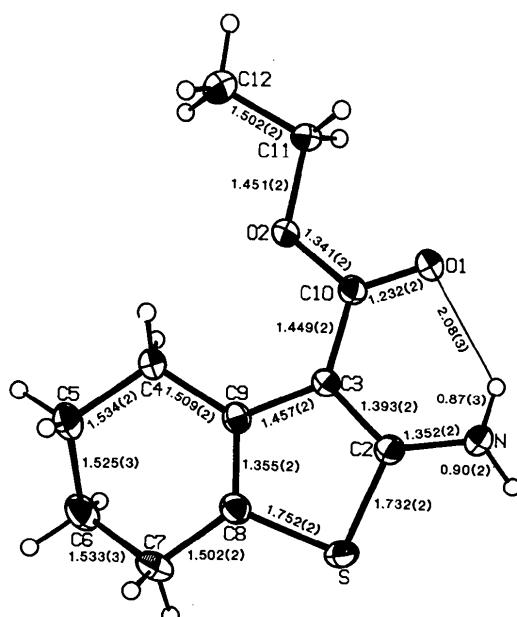

Table 2. Positions and U/U_{eq} for atoms in $\text{C}_{11}\text{H}_{15}\text{NO}_2\text{S}$

For non-H atoms, the U value is U_{eq} , calculated as $U_{\text{eq}} = \frac{1}{3} \sum_i \sum_j U_{ij} A_i^* A_j^* A_{ij}$, where A_{ij} is the dot product of the i th and j th direct-space unit-cell vectors.

Fig. 1. View of the title compound illustrating atom labeling and bond lengths (\AA) and e.s.d.'s. Thermal ellipsoids scaled to 50% probability. Bond angles ($^\circ$) with e.s.d.'s in the range 0.1–0.2 $^\circ$.

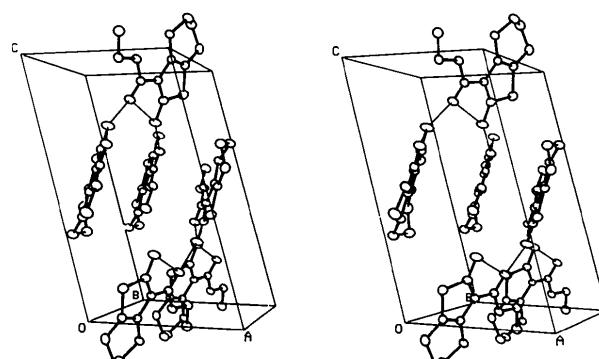

Fig. 2. Stereoview of the molecular packing.

the planarity of the entire system [excluding C(5) and C(6)]. Atomic parameters are given in Table 2.* Principal computer programs are cited in Gadol & Davis (1982); the least-squares-planes program was written by Cordes (1983).

Related literature. The structure was previously reported (Simonsen, 1972), but there was some difficulty with disorder in the cyclohexeno ring. In the present structure determination, the disorder shows up in the final electron density difference map in which peaks of 0.35 and 0.31 e Å⁻³ form a reasonable C(4)—C(5)—C(6)—C(7) chain with C—C distances of 1.66, 1.63 and 1.45 Å through the sequence. This fraction, amounting to approximately 5%, was ignored. The angle between the thiophene ring and the carboxyl group in the title compound differs greatly from the 79° found in 2-(*N,N*-diethylamino)-3-carbomethoxy-naphtho[2,3-*b*]thiophene-4,9-dione (DCMT) (Gibbons, Lerbscher & Trotter, 1972). DCMT cannot hydrogen

bond intramolecularly and, in fact, severe steric interactions prevent the carbomethoxy group from being coplanar with the thiophene ring.

The authors gratefully acknowledge the Robert A. Welch Foundation for support of this work through grant F-017 to SHS.
