Structure of the Bis[bis(diphenylphosphino)methane]digold(I) Cation in $[\text{Au}_2(\text{dppm})_2](\text{BF}_4)_2$

BY LEIGH CHRISTOPHER PORTER, MD. NAZRUL I. KHAN, CHRISTOPHER KING AND JOHN P. FACKLER JR*

Laboratory for Molecular Structure and Bonding, Texas A&M University, College Station, TX 77843, USA

(Received 9 September 1988; accepted 14 November 1988)

Abstract. Bis- μ -[bis(diphenylphosphino)methane- P,P']digold(I) bis(tetrafluoroborate), $[\text{Au}_2(\text{C}_{25}\text{H}_{22}\text{P}_2)_2](\text{BF}_4)_2$, $[\text{Au}_2\{(\text{C}_6\text{H}_5)_2\text{PCH}_2\text{P}(\text{C}_6\text{H}_5)_2\}_2](\text{BF}_4)_2$, $M_r = 1336.4$, monoclinic, $P2_1/a$, $a = 15.047(5)$, $b = 17.462(3)$, $c = 10.532(2)$ Å, $\beta = 117.59(2)^\circ$, $V = 2452(1)$ Å³, $Z = 2$, $D_x = 1.810 \text{ g cm}^{-3}$, $\lambda(\text{Mo } K\alpha) = 0.71073$ Å, $\mu = 61.56 \text{ cm}^{-1}$, $F(000) = 1288$, $T = 298 \text{ K}$. Final $R = 0.040$ for 2587 unique observed

reflections. This is the first structure of an $\text{Au}_2(\text{dppm})_2^{2+}$ cation in which the anion is not coordinated to an Au atom. The Au–Au separation is 2.931(1) Å.

Experimental. Addition of AgBF_4 to $[\text{Au}_2(\text{dppm})_2]\text{Cl}_2$ in tetrahydrofuran gave a precipitate which, on dissolving in CH_3CN and removing the solvent, gave $[\text{Au}_2(\text{dppm})_2](\text{BF}_4)_2$ in 93% yield. Analysis: C 45.29 (calculated 44.94), H 3.47 (3.32%). M.p. 493 K with decomposition. A colorless crystal, obtained by re-

crystallization from CH₃CN/diethyl ether, 0·17 × 0·16 × 0·24 mm, was mounted in a random orientation on a glass fiber. Axial dimensions and monoclinic symmetry were verified by axial rotation photographs. Refined cell parameters were obtained from the setting angles of 25 reflections with $30 < 2\theta < 35^\circ$. Data were collected on a Nicolet R3m/E diffractometer with graphite-monochromated Mo K α radiation using the ω -scanning technique in bisecting geometry. 3471 reflections ($+h \leq 17$, $+k \leq 19$, $|l| \leq 12$) measured with $0 < 2\theta < 45^\circ$. Scan rate variable, 2–30° min⁻¹; scan range –0·8° in ω from $K\alpha_1$ to +0·8° from $K\alpha_2$. Background intensities estimated from a 96-step peak profile. Three standard reflections (111, 020, 110) measured every 100 data. The data were corrected for standard variation (<1%) and Lorentz and polarization effects. Absorption corrections were applied using a Gaussian quadrature method following careful measurement of crystal dimensions and assignment of indices to the crystal faces (minimum and maximum transmission factors of 0·203 and 0·441). Structure determination used SHELXTL (Sheldrick, 1978). Scattering factors, including terms for anomalous dispersion, taken from International Tables for X-ray Crystallography (1974). Au-atom positions determined from a sharpened Patterson map; remaining non-H atoms located using difference Fourier techniques. All non-H atoms refined anisotropically, except for the F atoms. Phenyl rings refined as rigid hexagons (C–C = 1·39 Å; C–C–C = 120°); H atoms were placed in idealized positions with fixed thermal parameters [$U(H) = 0·08 \text{ \AA}^2$]. Least-squares refinement based on minimization of $\sum w(|F_o| - |F_c|)^2$ with weights of the form $w^{-1} = [\sigma^2(F_o) + 0·002033(F_o^2)]$. Convergence to conventional R values of $R = 0·040$ and $wR = 0·045$ obtained using 243 parameters and 2587 unique reflections with $F^2 > 3\sigma(F^2)$. For final cycle maximum shift/ $\sigma = 0·043$. The BF₄⁻ ion is

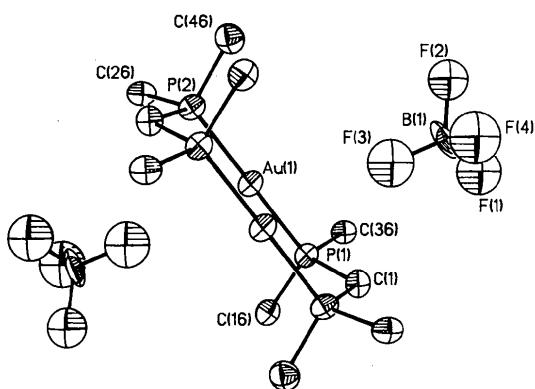

Fig. 1. View of [Au₂(dppm)₂](BF₄)₂. Thermal ellipsoids drawn at the 50% probability level. Only the *ipso* C atoms of the phenyl rings are shown. H atoms are omitted. Only one orientation of the disordered BF₄⁻ is shown.

* The equivalent isotropic *U* is defined as $\frac{1}{3}$ of the trace of the *U*_{ij} tensor.

disordered. A second orientation is obtained from the first by a C₆ rotation about the B(1)–F(1) axis. Occupancies refined to 60 (1)% for one orientation [F(2), F(3), F(4)] and 40 (1)% for the other [F(2a), F(3a), F(4a)]. Maximum residual electron density of +0·96 e Å⁻³ is 0·90 Å from F(4), indicating that the disorder model is imperfect. Slope of normal probability plot equals 0·925 with a goodness-of-fit indicator of 1·032. The compound, shown in Fig. 1, has a crystallographic center of symmetry. Atomic coordinates and equivalent isotropic thermal parameters are listed in Table 1; bond angles and distances are listed in Table 2. Fig. 2 shows the crystal packing.*

Related literature. The structures of [Au₂(dppm)₂]Cl₂ (Schmidbaur, Wohlleben, Wagner, Orama & Huttner, 1977), and [Au₂(dppm)₂]Br₂ and [Au₂(dppm)₂]I₂ (Shain & Fackler, 1987) have been reported. The preparation of [Au₂(dppm)₂](BPh₄)₂ has been described (Schmidbaur *et al.*, 1977).

Absolute Structure of Di- μ -sulfoacetato-bis{[(1*R*,2*R*)-1,2-diaminocyclohexane]-platinum(II)} Trihydrate

BY KOJIRO OKUDE, HIKARU ICHIDA, T. KEN MIYAMOTO AND YUKIYOSHI SASAKI

Department of Chemistry, Faculty of Science, The University of Tokyo, Tokyo 113, Japan

(Received 24 October 1988; accepted 30 November 1988)

Abstract. $[\text{Pt}_2(\text{C}_2\text{H}_2\text{O}_5\text{S})_2(\text{C}_6\text{H}_{14}\text{N}_2)_2] \cdot 3\text{H}_2\text{O}$, $M_r = 948.80$, orthorhombic, $P2_12_12_1$, $a = 19.186$ (4), $b = 14.577$ (2), $c = 9.876$ (1) \AA , $V = 2762$ (1) \AA^3 , $Z = 4$, $D_x = 2.28$, $D_m = 2.25$ Mg m^{-3} , $\lambda(\text{Mo } \text{Ka}) = 0.71069$ \AA , $\mu = 10.859$ mm^{-1} , $F(000) = 1816$, $T = 298$ K, $R = 0.033$, $wR = 0.031$ for 2455 independent reflections. Formal local charges on Pt atoms and SO_3 groups are not compensated and the molecule has a divalent zwitterionic character. The geometric requirement imposed by the bridging carboxyl group causes the relatively short Pt–Pt distance [3.0435 (8) \AA] but it

is slightly too long to be regarded as a metal–metal bond. Coordination planes around Pt are not parallel because of the steric repulsion between the cyclohexane rings (dihedral angle between the coordination planes is 42.9°).

Experimental. The title compound was synthesized from a reaction of dihydroxo[(1*R*,2*R*)-1,2-diamino-cyclohexane]platinum(II) and sulfoacetic acid and was recrystallized from H_2O . Yellow prism crystals; $0.23 \times 0.15 \times 0.10$ mm; D_m by flotation in $\text{C}_2\text{H}_4\text{Br}_2-\text{CH}_2\text{I}_2$.
