

corrected for this decay and for Lorentz and polarization effects, absorption ignored. 2437 reflections collected, 2338 unique, 1817 considered observed [$I \geq 3\sigma(I)$] and used in the refinement. Direct methods (*MULTAN80*, Main, Fiske, Hull, Lessinger, Germain, Declercq & Woolfson, 1980), block-matrix anisotropic least squares (*SHELX76*, Sheldrick, 1976), H atoms located in a ΔF map, those of N atoms not found, in the last cycles of refinement 12 reflections probably affected by extinction were excluded, $\sum w\Delta F^2$ minimized, unit weights, $R = 0.075$, $(\Delta/\sigma)_{\text{max}} = 0.09$, the final difference electron density map shows peaks from 0.28 to $-0.23 \text{ e } \text{\AA}^{-3}$, 167 and 216 parameters refined in two blocks. Atomic scattering factors were from *SHELX76*.

All the calculations were performed on an IBM PS2/80 personal computer with the *CRYSRULER* package (Rizzoli, Sangermano, Calestani & Andreetti, 1987). The final atomic parameters are in Table 1, Table 2 reports bond distances and angles and the molecule is illustrated in Fig. 1.*

Related literature. This paper is strictly related to other systematic analyses of monomers of epoxy resins (Bel'skii, Chernikova, Rotaru & Kruchinin, 1983; Grenier-Loustalot & Bocelli, 1983).

* Lists of structure factors, anisotropic thermal parameters and H coordinates with isotropic thermal parameters have been deposited with the British Library Document Supply Centre as Supplementary Publication No. SUP 51933 (11 pp.). Copies may be obtained through The Executive Secretary, International Union of Crystallography, 5 Abbey Square, Chester CH1 2HU, England.

A New Crystalline Modification of Spironolactone

BY V. AGAFONOV, B. LEGENDRE AND N. RODIER

Laboratoires de Chimie Minérale et de Cristallographie, Faculté de Pharmacie, 5 rue J.-B. Clément, 92996 Châtenay-Malabry CEDEX, France

(Received 20 April 1989; accepted 30 May 1989)

Abstract. 7α -Acetylthio-3-oxo- 17α -pregn-4-ene- $21,17\beta$ -carbolactone, $C_{24}H_{32}O_4S$, $M_r = 416.6$, orthorhombic, $P2_12_12_1$, $a = 10.584(4)$, $b = 11.005(2)$, $c = 18.996(3) \text{ \AA}$, $V = 2213(2) \text{ \AA}^3$, $Z = 4$, $D_x = 1.25 \text{ Mg m}^{-3}$, $\lambda(\text{Mo } K\alpha) = 0.7107 \text{ \AA}$, $\mu = 0.16 \text{ mm}^{-1}$, $F(000) = 896$, $T = 294 \text{ K}$, final $R = 0.047$ for 1237 reflections. The *A*-ring conformation is near that of a sofa, the *B* and *C* rings are chair shaped. The *D* ring is a distorted 13β envelope ($\Delta = 32.5^\circ$, $\varphi_m = 45.9^\circ$) and the *E* ring is almost a plane. All the molecules are held together by van der Waals forces.

The bioavailability of spironolactone (a useful diuretic, poorly soluble) depends on its allotropic form. Therefore, this crystalline modification, which is the more thermodynamically stable, has been studied.

Experimental. Single crystals prepared by cooling a supersaturated solution of spironolactone in acetone. Prismatic crystal: $0.22 \times 0.37 \times 0.40 \text{ mm}$. Enraf-Nonius CAD-4 diffractometer; lattice parameters determined from 25 reflections having $5.04 \leq \theta \leq$

Structure of the Simple Trichothecene 7α -Hydroxyscirpene

BY CLIFFORD GEORGE, JUDITH L. FLIPPEN-ANDERSON AND RICHARD GILARDI

Laboratory for the Structure of Matter, Naval Research Laboratory, Washington DC 20375, USA

(Received 10 April 1989; accepted 6 June 1989)

Abstract. 12,13-Epoxytrichothec-9-en- 7α -ol, $C_{15}H_{22}O_3$, $M_r = 250.3$, orthorhombic, $P2_12_12_1$, $a = 6.522(2)$, $b = 12.187(2)$, $c = 16.647(2)$ Å, $V = 1323.1(3)$ Å³, $Z = 4$, $D_x = 1.257$ Mg m⁻³, $\lambda(Cu K\alpha) = 1.54178$ Å, $\mu = 0.652$ mm⁻¹, $F(000) = 544$, $T = 295$ K, final $R = 0.034$, $wR = 0.036$ for 1043 independent reflections. The title compound is produced by deoxygenation of 7α -hydroxytrichodermol which is produced as a minor metabolite of *Myrothecium roridum* along with much larger amounts of macrocyclic roridum and verrucarin trichothecenes. The X-ray structure established the hydroxyl group at the

7α rather than the 8β position. The conformation of the trichothecene ring system matches closely that observed in other simple trichothecenes as well as that observed in a number of macrocyclic trichothecenes. Weak intermolecular hydrogen bonding occurs with the hydroxyl oxygen acting as a donor to the ring oxygen in the six-membered ring.

Experimental. A clear colorless $0.13 \times 0.15 \times 0.34$ mm data crystal was provided by Bruce Jarvis of the University of Maryland. Automated Nicolet R3m diffractometer with incident beam mono-
