Primed atoms are related by centre of inversion.

0.022, $wR = 0.025$, $w = [\sigma^2(F) + 0.001|F|^2]^{-1}$, $S = 1.16$, $(\Delta/\sigma)_{\text{max}} \leq 0.002$, $\Delta\rho_{\text{max}} = 0.36$, $\Delta\rho_{\text{min}} = -0.40 \text{ e } \text{\AA}^{-3}$; no extinction correction applied. Scattering factors for all atoms were as incorporated in *SHELX76* (Sheldrick, 1976). All calculations were performed on a Sun4/280 computer system. Atomic parameters are given in Table 1, selected interatomic parameters in Table 2* and the numbering scheme used is shown in Fig. 1, which was drawn with *ORTEP* (Johnson, 1971) at 15% probability levels.

* Lists of structure factors, anisotropic thermal parameters, H-atom parameters and all interatomic parameters have been deposited with the British Library Document Supply Centre as Supplementary Publication No. SUP 53533 (12 pp.). Copies may be obtained through The Technical Editor, International Union of Crystallography, 5 Abbey Square, Chester CH1 2HU, England.

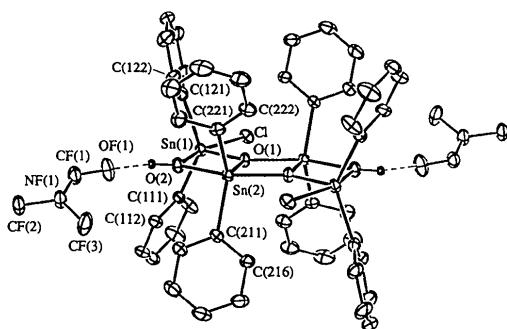

Fig. 1. Molecular structure and crystallographic numbering scheme employed for $[\text{Sn}_2(\text{Cl})(\text{O})(\text{OH})(\text{C}_6\text{H}_5)_4]_2 \cdot 2\text{C}_3\text{H}_7\text{NO}$ (Johnson, 1971).

Related literature. Closely related structures have been reported for $[(R_4\text{Sn}_2\text{ClO}_2\text{H})_2]$, for $R = i\text{-C}_3\text{H}_7$ (Puff, Bung, Friedrichs & Jansen, 1983) and $R = \text{C}_6\text{H}_5$, as an acetone solvate (Vollano *et al.*, 1984).

The Australian Research Council is thanked for support.

Structure of 1,4,5,8,9,10-Hexabromo-11,11-dimethoxytricyclo[6.2.1.0^{2,7}]undeca-4,9-diene-3,6-dione

BY CHAD L. PICOU, SAMMY R. HOMER, ROBERT A. BREYER, LOUIS W. REICHEL, GARY W. GRIFFIN AND EDWIN D. STEVENS

Department of Chemistry, University of New Orleans, New Orleans, LA 70148, USA

(Received 13 December 1989; accepted 9 August 1990)

Abstract. $\text{C}_{13}\text{H}_8\text{Br}_6\text{O}_4$, $M_r = 707.7$, orthorhombic, $Pna2_1$, $a = 12.711 (5)$, $b = 16.921 (4)$, $c = 8.455 (3) \text{ \AA}$, $V = 1818.5 (11) \text{ \AA}^3$, $Z = 4$, $D_x = 2.584 \text{ g cm}^{-3}$, $\lambda(\text{Mo } K\alpha) = 0.71073 \text{ \AA}$, $\mu = 131.4 \text{ cm}^{-1}$, $F(000) = 1312$, $T = 100 (4) \text{ K}$, final $R =$

0108-2701/91/030662-03\$03.00

0.043 for 883 reflections with $I > 3\sigma(I)$. The title compound is an *endo* addition product of 2,3-dibromobenzoquinone and 1,2,3,4-tetrabromo-5,5-dimethoxycyclopentadiene. The two remaining double bonds are parallel and separated by

3.34 (3) Å, a configuration which allows further intramolecular cyclization. The shortest intermolecular contact is 2.91 (1) Å between Br(5) and O(2).

Experimental. The title compound was synthesized via a [4 + 2] cycloaddition of 2,3-dibromobenzoquinone and 1,2,3,4-tetrabromo-5,5-dimethoxycyclopentadiene. A colorless needle-shaped crystal with approximate dimensions $0.6 \times 0.3 \times 0.3$ mm was glued to a glass fiber and mounted on an Enraf-Nonius CAD-4 diffractometer with graphite crystal monochromator. Unit cell parameters were obtained from least-squares refinement of the setting angles of 25 reflections with $24 < 2\theta < 42^\circ$ using Mo $K\alpha$ radiation. Systematic absences, $0kl$: $k + l = 2n + 1$ and $h0l$: $h = 2n + 1$ indicated space group $Pna2_1$ or $Pnma$. The non-centrosymmetric space group, $Pna2_1$, was chosen on the basis of intensity statistics and confirmed by successful determination of the structure. Intensities measured using $\omega:2\theta$ scans within the ranges $2 \leq 2\theta \leq 44^\circ$, $0 \leq h \leq 13$, $0 \leq k \leq 17$, $0 \leq l \leq 8$. The intensities of three standard reflections measured at 2 h intervals showed a variation of -5.3% during data collection and linear decay correction was applied. Absorption as a function of ψ was measured and an empirical absorption correction applied, with transmission coefficients ranging from 0.011 to 0.009. Lorentz and polarization corrections were applied to a total of 1196 measured reflections of which 883 were considered observed [$I > 3\sigma(I)$].

The structure was determined by direct methods using MULTAN80 (Main, Fiske, Hull, Lessinger, Germain, Declercq & Woolfson, 1980; modified by Frenz, 1982). Peaks corresponding to the six Br atoms were located in the *E* map and the positions of the remaining 17 non-H atoms were determined in a subsequent difference Fourier synthesis. The eight H-atom positions were calculated and added as a fixed contribution. Refinement was by full-matrix least-squares minimization of $\sum w(|F_o| - |F_c|)^2$, where $w = 1/\sigma^2(F)$ and $\sigma^2(F^2) = \sigma_{cs}^2 + (0.04F^2)^2$. Positional and anisotropic thermal parameters were refined for the Br atoms, positional and isotropic thermal parameters were refined for all other atoms. The refinement converged at $R = 0.045$, $wR = 0.056$, $S = 1.83$ and $(\Delta/\sigma)_{\text{max}} = 0.001$ for 114 variables. To test for the correct absolute configuration, the inversion operation was applied to the atomic coordinates and the refinement repeated. Final $R = 0.043$, $wR = 0.054$, $S = 1.76$ and $(\Delta/\sigma)_{\text{max}} = 0.001$ indicating that the initial assignment of an absolute configuration was incorrect. Max. and min. peak heights in the final difference Fourier synthesis were 1.52 and -0.67 e Å $^{-3}$, respectively. Atomic scattering factors and anomalous-dispersion corrections taken from International Tables for X-ray Crystallography (1974,

Table 1. *Positional parameters and their estimated standard deviations*

Starred atoms were refined isotropically. Anisotropically refined atoms are given in the form of the isotropic equivalent thermal parameter defined as:
