## Di- $\mu$ -iodo-bis[tetracarbonylmanganese(I)]

BY JULIAN A. DAVIES, MONIEM EL-GHANAM AND A. ALAN PINKERTON

*Department of Chemistry, University of Toledo, Toledo, OH 43606, USA*

(Received 20 September 1990; accepted 2 January 1991)

**Abstract.**  $[\text{Mn}_2\text{I}_2(\text{CO})_8]$ ,  $M_r = 587.77$ , monoclinic,  $P2_1/c$ ,  $a = 9.759$  (1),  $b = 12.252$  (2),  $c = 13.017$  (2) Å,  $\beta = 108.65$  (1)°,  $V = 1474.8$  (1.7) Å<sup>3</sup>,  $Z = 4$ ,  $D_x = 2.65$  g cm<sup>-3</sup>,  $\lambda(\text{Mo } \text{K}\alpha) = 0.71073$  Å,  $\mu = 58.2$  cm<sup>-1</sup>,  $F(000) = 1072$ ,  $T = 294$  (1) K,  $R = 0.032$  for 1877 unique reflections with  $F_o^2 > 3\sigma(F_o^2)$  of 3212 total data. The I atoms form the dimer. There is pseudo octahedral geometry around the Mn atoms. Ranges of bond lengths and angles: I–Mn 2.691 (1)–2.710 (1), Mn–C<sub>eq</sub> 1.797 (9)–1.815 (8), Mn–C<sub>ax</sub> 1.865 (9)–1.882 (8), Mn…Mn 3.986 (1), C<sub>eq</sub>–O 1.122 (9)–1.16 (1), C<sub>ax</sub>–O 1.108 (9)–1.127 (9) Å, Mn–C–O 177.6 (6)–180 (1), I–Mn–C<sub>ax</sub> 88.0 (2)–89.7 (2), I–Mn–C<sub>eq</sub> 91.2 (3)–92.7 (2), Mn–I–Mn 95.09 (3)–95.10 (3), I–Mn–I 84.61 (3)–85.16 (3)°.

**Introduction.** Since the first synthesis of manganese pentacarbonyl iodide in 1954 (Brimm, Lynch & Sesny, 1954), other carbonyl halides of manganese (Cl, Br) have been prepared and their utility in organometallic synthesis has become apparent (Wimmer & Snow, 1978). These compounds undergo thermal dissociation of coordinated carbon monoxide and dimerization to produce bis[halotetracarbonylmanganese(I)] (Brimm, Lynch & Sesny, 1954), according to the following stoichiometry

It is known that the thermal decomposition of manganese pentacarbonyl iodide to the correspond-

ing bis[iodotetracarbonylmanganese(I)] is easier (Abel & Wilkinson, 1959) than the corresponding dimerization of the rhenium analog, whose X-ray structure has been reported previously (Darst, Lenhart, Lukehart & Warfield, 1980). Although both  $[\text{Mn}_2\text{Cl}_2(\text{CO})_8]$  (Clegg & Morton, 1978) and  $[\text{Mn}_2\text{Br}_2(\text{CO})_8]$  (Dahl & Wei, 1963) have been characterized crystallographically  $[\text{Mn}_2\text{I}_2(\text{CO})_8]$  has not. In order to complete the series of manganese dimers and to allow comparisons with  $[\text{Re}_2\text{I}_2(\text{CO})_8]$ , we describe here the structural characterization of  $[\text{Mn}_2\text{I}_2(\text{CO})_8]$ .

**Experimental.** The complex  $[\text{Mn}_2\text{I}_2(\text{CO})_8]$  was prepared by the reaction of  $[\text{Mn}(\text{CO})_5]^-$  with diiodoacetylene as reported previously (Davies, El-Ghanam, Pinkerton & Smith, 1990). This compound was isolated with other products of the reaction and then separated.  $[\text{Mn}_2\text{I}_2(\text{CO})_8]$  was first identified by infrared and mass spectroscopy. IR (KBr disk):  $\nu(\text{CO})$  1844 (vw), 1868 (w), 1890 (w), 1951 (m), 1960 (w), 1978 (s), 2004 (m), 2026 (m), 2036 (m), 2087 (vs) cm<sup>-1</sup>; MS (70 eV; EI):  $M^+$  (558),  $M^+ - 3\text{CO}$  (504),  $M^+ - 4\text{CO}$  (476),  $M^+ - 5\text{CO}$  (448),  $M^+ - 6\text{CO}$  (420),  $M^+ - 7\text{CO}$  (392),  $\text{Mn}_2\text{I}_2^+$  (364),  $\text{Mn}_2\text{I}^+$  (237),  $\text{MnI}^+$  (182),  $\text{I}^+$  (127),  $\text{Mn}^+$  (55).  $[\text{Mn}_2\text{I}_2(\text{CO})_8]$  was crystallized from hexane to give a brown crystalline material found to be suitable for X-ray analysis. Crystal 0.34 × 0.14 × 0.08 mm; Enraf–Nonius CAD-4 computer-controlled  $\kappa$ -axis diffractometer, graphite monochromator; cell dimensions from setting angles of 25 reflections,  $10^\circ < \theta <$

15°;  $\omega$ - $2\theta$  scan; max.  $2\theta = 52^\circ$ ;  $h$  0 to 12,  $k$  0 to 15,  $l$  -16 to 15; empirical absorption (from 0.61–0.99 on  $I$ ); three standard reflections, decay 7.7%, intensities adjusted accordingly; 3212 data, 3033 unique,  $R_{\text{int}} = 2.2\%$ , structure solved by direct and Fourier methods; refined by full-matrix least squares minimizing  $\sum w(|F_o| - |F_c|)^2$ ,  $w = 4F_o^2/\sigma^2(F_o)^2$ , 182 parameters; final  $R = 0.032$ ,  $wR = 0.039$  for 1877 reflections with  $F_o^2 > 3\sigma F_o^2$ ; max. shift to e.s.d. = 0.19; max. and min. of difference Fourier synthesis 0.70 (16) and -0.78 (16) e Å<sup>-3</sup>, e.s.d. of observations of unit weight = 1.12, atomic scattering factors for neutral Mn, I, C and O atoms, and values of  $f'$  and  $f''$  for all atoms from *International Tables for X-ray Crystallography* (1974, Vol. IV, Tables 2.2 and 2.3.1); computer programs *SDP/VAX* (Frenz, 1978). The figure was prepared using *ORTEP* (Johnson, 1971).

**Discussion.** The compound (Fig. 1) was prepared by the reaction of [Mn(CO)<sub>5</sub>]<sup>-</sup> and IC≡CI. The reaction proceeds by formal I<sup>+</sup> abstraction to give [Mn(CO)<sub>5</sub>I] which undergoes dimerization to [Mn<sub>2</sub>I<sub>2</sub>(CO)<sub>8</sub>], a major product of this reaction. Structure refinement was completed in order to make comparisons with [Mn<sub>2</sub>Br<sub>2</sub>(CO)<sub>8</sub>] (Dahl & Wei, 1963), [Mn<sub>2</sub>Cl<sub>2</sub>(CO)<sub>8</sub>] (Clegg & Morton, 1978) and [Re<sub>2</sub>I<sub>2</sub>(CO)<sub>8</sub>] (Darst, Lenhart, Lukehart & Warfield, 1980). Final atomic coordinates are listed in Table 1 and derived bond lengths and angles in Table 2.\*

The coordination geometry around the Mn atoms in [Mn<sub>2</sub>I<sub>2</sub>(CO)<sub>8</sub>] is formally octahedral with the two iodide ligands bridging the manganese centers. Inspection of Table 3 shows that the  $M-X$  distances in  $[M_2X_2(\text{CO})_8]$  follow the expected trend, i.e. where  $M = \text{Mn}$ ,  $M-X$  increases in the order  $X = \text{Cl} < \text{Br} < \text{I}$  and where  $X = \text{I}$ ,  $M-X$  increases in the order  $M$

Table 3. *Crystallographic data (Å, °) for some  $[M_2X_2(\text{CO})_8]$  complexes*

	[Mn <sub>2</sub> Cl <sub>2</sub> (CO) <sub>8</sub> ]	[Mn <sub>2</sub> Br <sub>2</sub> (CO) <sub>8</sub> ]	[Mn <sub>2</sub> I <sub>2</sub> (CO) <sub>8</sub> ]	[Re <sub>2</sub> I <sub>2</sub> (CO) <sub>8</sub> ]
$M-C$ trans to halogen	1.816 (2)	1.76 (4)	1.803 (4)	1.91 (3)
$M-C$ cis to halogen	1.888 (2)	1.87 (4)	1.874 (3)	2.00 (3)
$M-X$	2.395 (1)	2.526 (5)	2.7007 (5)	2.820 (2)
$M\cdots M$	3.569 (1)	3.743 (8)	3.986 (1)	4.218 (2)
$X-M-X$	83.7 (1)	84.4 (2)	84.884 (2)	83.18 (4)

= Mn < Re. The  $X$ —M—X angles increase in the order  $X$  = Cl < Br < I, where M = Mn and in the order Re < Mn where X = I, entirely as expected based on covalent radii. The M—CO distances for the carbonyl groups *cis* to X in  $[M_2X_2(\text{CO})_8]$  differ significantly from the M—CO distances *trans* to X; in every case the *cis* bonds are longer as anticipated based on the known *trans*-influences of the groups involved. The C—O bond lengths shorten as M—C lengthens owing to less effective back bonding from manganese. Unfortunately, comparisons of M—CO bond distances as X is varied are hindered by the low accuracy of the bond lengths for  $[\text{Mn}_2\text{Br}_2(\text{CO})_8]$ , whose structure was solved from photographic data. The nonbonded Mn···Mn distances in  $[\text{Mn}_2X_2(\text{CO})_8]$  (all > 3.5 Å) are significantly longer than the Mn—Mn distance of 2.923 (3) Å in  $[\text{Mn}_2(\text{CO})_{10}]$  (Dahl & Rundle, 1963) confirming the absence of any metal–metal interaction.

We thank the donors of the Petroleum Research Fund, administered by the American Chemical

Society, for support of this work and the College of Arts and Sciences for support of the X-ray crystallographic facilities.

(Received 16 July 1990; accepted 2 January 1991)

**Abstract.**  $(\text{Ni}_{0.97}\text{Fe}_{0.03})_8(\text{Si}_{0.79}\text{P}_{0.21})_3$ ,  $M_r = 550$ , trigonal,  $R\bar{3}c$ , hexagonal axes,  $a = 6.640 (2)$ ,  $c = 37.982 (7)$  Å,  $V = 1450.3 (7)$  Å<sup>3</sup>,  $Z = 12$  [96 Ni(Fe) and 36 Si(P) per unit cell],  $D_x = 7.63 (1)$  Mg m<sup>-3</sup>,  $\lambda(\text{Mo } K\alpha) = 0.71073$  Å,  $\mu = 31.07$  mm<sup>-1</sup>,  $F(000) = 3194$ ,  $T = 295$  K, final  $R = 0.027$ ,  $wR = 0.019$  for 333 independent reflections. The structure was found to be isomorphous with that of  $\text{Pd}_8\text{Sb}_3$ , and also a stacking variant of  $\text{Ni}_3\text{Si}_{12}$  and  $\text{Pd}_5\text{Sb}_2$  structures.

**Introduction.** In the highly reduced stony meteorites, *i.e.* enstatite chondrites and enstatite achondrites, it has been known that a nickel silicide mineral called perryite occurs as thin rims around and as thin

lamellae within metallic nickel–iron grains. The chemical composition of perryite as determined by electron probe microanalysis is Ni 75.5–83.7, Fe 1.7–9.4, Si 9.7–15.0 and P 2.4–5.2 wt% (Fredriksson & Henderson, 1965; Okada, Keil & Taylor, 1988; Reed, 1968; Wai, 1970).

Natural perryite crystals in meteorites which are usually less than 20 µm are too small to be used for single-crystal structure analysis. This is the main reason why the crystal structure and the accurate chemical formula of perryite have not been clarified. We synthesized the crystal by melting the materials, the composition obtained is almost the same as that of perryite in the Norton County enstatite achondrite
