(Received 24 May 1991; accepted 4 December 1991)

**Abstract.**  $[\text{Cu}(\text{C}_{10}\text{H}_8\text{N}_2)_2(\text{NCO})]\text{ClO}_4$ ,  $M_r = 517.39$ , triclinic,  $P\bar{1}$ ,  $a = 10.20$  (2),  $b = 13.55$  (4),  $c = 7.98$  (1) Å,  $\alpha = 90.7$  (2),  $\beta = 99.7$  (2),  $\gamma = 105.1$  (2)°,  $V = 1047$  (4) Å<sup>3</sup>,  $Z = 2$ ,  $D_x = 1.640$  Mg m<sup>-3</sup>,  $\lambda(\text{Mo } K\alpha) = 0.71069$  Å,  $\mu = 1.22$  mm<sup>-1</sup>,  $F(000) = 526$ ,  $T = 293$  K,  $R = 0.056$ , 1970 unique reflexions [ $I \geq 3\sigma(I)$ ]. The Cu environment is a distorted trigonal bipyramidal with each of the bipyridine ligands forming equatorial [2.095 (8), 2.111 (7) Å] and somewhat shorter axial [2.007 (9), 1.981 (8) Å] Cu—N bonds. However, at 1.961 (8) Å, the equatorial isocyanide ligand forms the shortest Cu—N bond.

**Experimental.** The compound was obtained as a side product during the synthesis of Cu complexes of 2(*1H*)-pyridone by use of an electrochemical method proposed by Tuck (Habeeb, Tuck & Walters, 1978). The electrochemical oxidation of a Cu anode in an acetonitrile solution (70 ml) containing 2,2'-bipyridine (0.12 g), 2(*1H*)-pyridone (0.15 g) and tetramethylammonium perchlorate (*ca* 10 mg) led to the formation of a green solid. On standing for several days at room temperature an additional green solid was recovered from the mother liquor. This was recrystallized from methanol to give crystals suitable for X-ray investigation.

Crystal dimensions 0.3 × 0.3 × 0.2 mm; Rigaku AFC-6S diffractometer, graphite-monochromated Mo  $K\alpha$  radiation; unit-cell dimensions from setting angles of 25 accurately centred reflexions (12.1 ≤  $2\theta$  ≤ 16.1°);  $\omega$ -2θ scan mode,  $\omega$ -scan width (0.84 + 0.30tanθ)° and scan speed of 4° min<sup>-1</sup> with up to two additional scans of weak reflexions [ $I < 10\sigma(I)$ ]; 0 ≤  $h$  ≤ 12, -15 ≤  $k$  ≤ 15, -9 ≤  $l$  ≤ 9, 0 ≤  $\theta$  ≤ 25°; 4459 reflexions measured, 3698 unique, 1970 observed [ $I \geq 3\sigma(I)$ ]; intensity standards (241, 241, 250) measured every 150 reflexions showed no drift; Lp and absorption (maximum, minimum transmission 0.95, 1.0) corrections applied; MITHRIL (Gilmore, 1984) used to solve the phase problem; all non-H atoms found in Fourier map, H atoms from

nates and vibrational parameters for non-H atoms are presented in Table 1 and selected bond lengths and angles in Table 2.\* The title molecule, including atomic labelling, is displayed in Fig. 1.

**Related literature.** The square-pyramidal distorted trigonal bipyramidal geometry seen here is very similar to that in bis(2,2'-bipyridyl)thiocyanatocopper(II) tetrafluoroborate (Tyagi & Hathaway, 1981). The relatively short equatorial thiocyanate Cu—N bond is interpreted as resulting from an angular distortion away from a trigonal bipyramid rather than to the potentially  $\pi$ -bonding role of the thiocyanate ligand.

We thank the Xunta de Galicia for a grant.

## Structure of L-Phenylalanine L-Phenylalaninium Formate

BY CARL HENRIK GÖRBITZ\* AND MARGARET C. ETTER†

Department of Chemistry, University of Minnesota, Minneapolis, Minnesota 55455, USA

(Received 4 June 1991; accepted 11 November 1991)

**Abstract.**  $C_9H_{11}NO_2C_9H_{12}NO_2^+ \cdot CHO^-$ ,  $M_r = 376.41$ , monoclinic,  $P2_1$ ,  $a = 11.507$  (6),  $b = 5.638$  (3),  $c = 14.610$  (5) Å,  $\beta = 100.65$  (4)°,  $V = 932$  (1) Å<sup>3</sup>,  $Z = 2$ ,  $D_x = 1.342$  g cm<sup>-3</sup>,  $\lambda(Mo K\alpha) = 0.7107$  Å,  $\mu = 0.94$  cm<sup>-1</sup>,  $F(000) = 400$ ,  $T = 295$  K, final  $R = 0.047$  for 2693 observed reflections. The phenylalanine zwitterion and the phenylalanine cation form a

Speakman-salt-type hydrogen bond [ $O \cdots O = 2.496$  (3) Å]. Aromatic side chains constitute a thick hydrophobic layer with edge-to-face interactions between the phenyl rings.

**Introduction.** Structural studies of peptides are often hampered by difficulties in obtaining crystals large enough for X-ray diffraction. Based on our success in controlling crystal morphology and size of small molecular crystals using cocrystallization techniques (Etter, 1988), we have now turned our attention to
