Intensity data were collected with θ -scan widths of $(0.8 + 0.346\tan\theta)^\circ$, a θ -scan rate of 2° min^{-1} and background counts of 7 s at each end of every scan. H atoms, with the exception of those on C34 and C114, were observed in a $\Delta\rho$ synthesis. H atoms were placed at geometrically determined positions (those on C34 and C114 were assumed to be disordered over the two orientations giving rise to staggered conformations with respect to the β atoms) and held fixed during the least-squares refinement, but were periodically recalculated. All non-methyl H atoms were given a common U parameter which was refined, and methyl H atoms were treated likewise. The absolute configuration was assigned to conform with the known chirality of the compound's precursors. Refinement was by full-matrix least-squares methods.

Lists of structure factors, anisotropic thermal parameters, H-atom coordinates, and complete geometry have been deposited with the British Library Document Supply Centre as Supplementary Publication No. SUP 55050 (18 pp.). Copies may be obtained through The Technical Editor, International Union of Crystallography, 5 Abbey Square, Chester CH1 2HU, England. [CIF reference: HL1000]

Abstract

The structure of diammonium hexaaquanickel bis(monofluorophosphate) consists of $\text{Ni}(\text{H}_2\text{O})_6^{2+}$ and NH_4^+ cations and PO_3F^{2-} anions held together by hydrogen bonds involving all H atoms except one belonging to the ammonium cation. The Ni atoms are octahedrally coordinated by the six water molecules.

Comment

The present work forms part of a structural study of monofluorophosphates. The corresponding alkali-metal salts have been widely studied (Durand, Cot & Galigné, 1974, 1978; Galigné, Durand & Cot, 1974; Durand, Granier, Cot & Galigné, 1975; Payen, Durand, Cot & Galigné, 1979). However, the fluorophosphates of divalent transition metals have received less attention. Only the structures of

$\text{ZnPO}_3\text{F}_2\text{H}_2\text{O}$ (Durand, Larbot, Cot, Duprat & Dabosi, 1983) and $\text{CoPO}_3\text{F}_3\text{H}_2\text{O}$ (Durand, Cot, Berraho & Rafiq, 1987) are known. In addition, the structure of SnPO_3F (Berndt, 1974) has been published. In this work, we report the synthesis and crystal structure of the title compound, a new mixed phase which was isolated during experiments aimed at the synthesis of $\text{NiPO}_3\text{F}_x\text{H}_2\text{O}$.

The structure is represented in Fig. 1, viewed along the a axis. It can be described as layers, parallel to the ac plane, in which PO_3F^{2-} anions and NH_4^+ and $\text{Ni}(\text{H}_2\text{O})_6^{2+}$ cations are held together by hydrogen bonds, involving F, N and all the other O atoms. The bridging H atoms are H(2) and H(3) (both belonging to NH_4^+) and H(41), H(51), H(61) and H(62) of the water molecules. The layers are joined by additional hydrogen bonds connecting water molecules [O(4) and O(5)] with O(2) and O(3) of the PO_3F^{2-} group, the bridging atoms being H(1), H(42) and H(52). Thus, H(4) is the only H atom not involved in the hydrogen-bond interactions.

The Ni atoms, located at centres of symmetry, are coordinated by six water molecules forming a distorted octahedron; the Ni—O distances are as expected. The same can be said of the P—O distances. The P—F distance [1.601 (1) Å] is similar to that obtained by theoretical calculations [1.599 Å (Serafini, Labarre, Granier & Cot, 1976)], but is significantly longer than those observed in $\text{ZnPO}_3\text{F}_2\text{H}_2\text{O}$ (Durand, Larbot, Cot, Duprat & Dabosi, 1983) and in $\text{CoPO}_3\text{F}_3\text{H}_2\text{O}$ [1.548 (6) and 1.567 (2) Å, respectively (Durand, Cot, Berraho &

Rafiq, 1987)]. Following the interpretation of Durand, Granier, Cot & Galigné (1975), this lengthening could be correlated with a weakening of the P—F bond, owing to the hydrogen-bond interaction which does not occur in the Co and Zn compounds where the F atoms are only bonded to the P atoms. The Ni atoms are only coordinated by water molecules. In contrast, the metal environment in the Co and Zn derivatives is formed by O atoms from both the fluorophosphate anions and the water molecules.

Symmetry code: (i) $x, y, 1+z$; (ii) $1-x, -y, 1-z$; (iii) $-x, -y, 1-z$; (iv) $x-1, y, z$; (v) $x, -y+\frac{1}{2}, z-\frac{1}{2}$.

The title compound was prepared from a mixture (molar ratio 1:1) of aqueous solutions of $(\text{NH}_4)_2\text{PO}_3\text{F}\cdot\text{H}_2\text{O}$ and $\text{Ni}(\text{NO}_3)_2\cdot 6\text{H}_2\text{O}$. Green single crystals were grown by slow evaporation at room temperature. The IR spectrum revealed the presence of both NH_4^+ and PO_3F^{2-} ions. Crystals decomposed in air; to collect data, they were mounted in sealed glass capillaries. In spite of this, crystal decay was observed during data collection. The final intensities of standard reflections dropped by up to 73 % of their initial values. Intensities were collected with a scan amplitude of 1.5° and speed of 0.6°s^{-1} . Calculations were performed with DIRIDIF (Beurskens *et al.*, 1984), XRAY80 (Stewart, Kundell & Baldwin, 1980), PESOS (Martinez-Ripoll & Cano, 1975) and PLUTO (Motherwell & Clegg, 1978). The weighting scheme applied by PESOS was $w = K/F(f)F(s)$, where $K = 0.5785$, $F(s) = 6.4971 - 21.0696(\sin\theta/\lambda) + 18.9012(\sin\theta/\lambda)^2$ and $F(f) = a + bF_{\text{obs}} + cF_{\text{obs}}$. The values of a , b and c were as follows:

a	b	c	
1.1255	-0.2964	0.0269	$F_{\text{obs}} < 7.5$
0.2515	0.0118	0.0	$7.5 < F_{\text{obs}} < 20.0$
-0.0032	0.0235	0.0	$20.0 < F_{\text{obs}} < 29.0$
-0.3053	0.0329	0.0	$29.0 < F_{\text{obs}}$

This work forms part of the Cooperation Agreement between CSIC, Spain, and the Université de Marrakech, Morocco. We wish to express our thanks to both Institutions for financial support.

Abstract

The 1,3-dioxepane ring adopts a twist-boat conformation with the acetylaminoc and hydroxy groups occupying *cis* positions with respect to the ring. Two intramolecular hydrogen bonds [$\text{N}-\text{H} \cdots \text{OH}$ of 2.774(4) and $\text{O}-\text{H} \cdots \text{OCH}_2$ of 2.808(3) \AA] fix the conformation, and to-
