Structure of 2,4,6-Trinitro-8,10-dipropionyl-2,4,6,8,10-pentaazabicyclo[5.3.0]decane

BY JUDITH L. FLIPPEN-ANDERSON, CLIFFORD GEORGE AND RICHARD GILARDI

Laboratory for the Structure of Matter, Naval Research Laboratory, Washington, DC 20375, USA

(Received 26 August 1991; accepted 24 December 1991)

Abstract. C₁₁H₁₈N₈O₈, $M_r = 390.3$, orthorhombic, *Pbca*, $a = 6.552$ (2), $b = 25.794$ (6), $c = 19.412$ (5) Å, $V = 3281$ (2) Å³, $Z = 8$, $D_x = 1.581$ Mg m⁻³, $\lambda(\text{Cu } K\alpha) = 1.54184$ Å, $\mu = 1.12$ mm⁻¹, $F(000) = 1632$, $T = 295$ K, final $R = 0.054$, $wR = 0.055$ for 1481 independent observed reflections. The five-membered ring is essentially planar while the seven-membered ring has adopted a chair conformation. All three nitro groups are pyramidal with N—N to C—N—C angles of 19.8, 28.6 and 29.5°.

Experimental. A clear colorless needle $0.04 \times 0.08 \times 0.75$ mm data crystal, recrystallized from acetone, was provided by Dr Clifford L. Coon of Livermore

National Laboratory. An automated Siemens *R3m/V* diffractometer with incident beam monochromator was used for data collection. 25 centered reflections within $40.0 \leq 2\theta \leq 56.0^\circ$ were used for determining lattice parameters. $(\sin\theta/\lambda)_{\max} = 0.56$ Å⁻¹, range of hkl : $-6 \leq h \leq 4$, $0 \leq k \leq 27$, $0 \leq l \leq 20$. Standards 240, 082 and 006, monitored every 97 reflections, showed random variation of 2.5% over data collection: $\theta/2\theta$ scan mode, scan width $[2\theta(K\alpha_1) - 1.0]$ to $[2\theta(K\alpha_2) + 1.0]^\circ$, ω -scan rate a function of count rate ($3.0^\circ \text{ min}^{-1}$ minimum, $15.0^\circ \text{ min}^{-1}$ maximum), 4185 reflections measured, 2057 unique, $R_{\text{int}} = 1.0\%$, 1481 observed with $F_o > 3\sigma(F_o)$. Data were corrected for Lorentz and polarization effects but not for absorp-

Table 1. Atomic coordinates ($\times 10^4$) and equivalent isotropic displacement coefficients ($\text{\AA}^2 \times 10^3$)Equivalent isotropic U is defined as one third of the trace of the orthogonalized U_{ij} tensor.

tion. The structure solution, by direct methods, and the full-matrix least-squares refinement (on F) used programs in *SHELXTL* (Sheldrick, 1980). $\sum w(|F_o| - |F_c|)^2$ was minimized, where $w = 1/[\sigma^2(|F_o|) + g(F_o)^2]$, $g = 0.000225$. 245 parameters were refined: atomic coordinates and anisotropic thermal parameters for all non-H atoms, H atoms included using a riding model [coordinate shifts of C applied to attached H atoms, C—H distance set to 0.96 Å, H angles idealized, $U_{iso}(H)$ set to 1.1 $U_{eq}(C)$ or, if methyl, 1.2 $U_{eq}(C)$]. $(\Delta/\sigma)_{max} = 0.01$, ratio of observations to parameters = 6.0:1, $R = 0.054$, $wR = 0.055$, $S = 1.68$ ($R = 0.077$ for all data). Final difference Fourier excursions were at 0.22 and -0.28 e \AA^{-3} . Atomic scattering factors were taken from *International Tables for X-ray Crystallography* (1974, Vol. IV).^{*} Atom numbering for Tables 1 (atom coordinates) and 2 (bond distances and angles) follows that shown in Fig. 1.

Related literature. A search of the January 1991 release of the Cambridge Structural Database (Allen, Kennard & Taylor, 1983) did not reveal any structures with an identical pentaazabicyclo[5.3.0]decane ring system.
