A solution of sodium barbital (1 mmol) in 10 ml H_2O was added dropwise to a solution of 6,6'-diquinolyl ether (1 mmol) in 15 ml absolute alcohol at room temperature (294 K), with constant stirring for 2 h. Brown stick-like or plate-like crystals were grown from the mixed solution after 10 d. The crystals were filtered, washed with H_2O and absolute alcohol. Analysis: calculated for $\text{C}_{26}\text{H}_{24}\text{N}_4\text{O}_4$: C 68.40, H 5.30, N 12.28%; found: C 68.18, H 5.12, N 12.40%.

Structure analysis was performed with the SDP program on a PDP11/44 computer. The crystal structure was solved by direct methods. The positions of 34 non-H atoms in the asymmetric unit were determined with MULTAN82 (Main *et al.*, 1982). The positions of all H atoms were determined by difference Fourier syntheses. The refinements were carried out with unit weights by full-matrix least squares for the coordinates of all atoms and anisotropic thermal parameters for the non-H atoms (isotropic thermal parameters for H atoms were fixed at 5\AA^2).

Lists of structure factors, anisotropic thermal parameters, and H-atom coordinates have been deposited with the British Library Document Supply Centre as Supplementary Publication No. SUP 55380 (19 pp.). Copies may be obtained through The Technical Editor, International Union of Crystallography, 5 Abbey Square, Chester CH1 2HU, England. [CIF reference: CR0411]

Abstract

The unambiguous identification by X-ray diffraction of the (E) configuration of the title compound confirms a previous tentative assignment by NMR. The two planar rings (phenyl and pyridyl) are at an angle of about 70° . Crystal cohesion is ensured by a dense network of van der Waals contacts.

Comment

The structure determination of the *gem*-disubstituted vinyl sulfide was undertaken to confirm the (*E*) configuration suggested for this stereoisomer by ^1H NMR spectroscopy results. The stereochemistry of such prochiral vinyl sulfides (Madesclaire, Roche, Fauve & Veschambre, 1990) is of great interest as their asymmetric sulfoxidation yields chiral synthons which are widely used in organic synthesis (Solladié, 1988). In addition, these α,β -unsaturated sulfides possess antianoxia activity and may also act as free-radical scavengers which are useful in the cardiovascular field (Madesclaire, Roche & Duroux, unpublished). The angle between the phenyl and pyridyl rings is 69.4° and the plane containing the vinyl group (C1, C7, C13, C14) makes angles of 57.0 and 24.3° with the planes of the phenyl and pyridyl rings respectively. This relative disposition of the aromatic rings prevents delocalization of the π electrons.

The S—C bond lengths [S15—C14 1.752 (2), S15—C16 1.793 (3) Å] and the C—S—C and C=C—S angles [C14—S15—C16 100.1 (1), C13—C14—S15 124.9 (2) $^\circ$] are comparable with published values for other vinyl sulfides [1.752 (10), 1.794 (12) Å, 102.5 (2), 127.0 (2) $^\circ$ (Derissen & Bijen, 1973); 1.759 (8), 1.795 (8) Å, 102.1 (5), 127.5 (7) $^\circ$ (Samdal, Seip & Torgrimsen, 1979)]. The angle C10—N11—C12 is slightly smaller [116.4 (2) $^\circ$] than the other angles in the pyridyl ring. Crystal cohesion is ensured by the three-dimensional network of van der Waals interactions listed in Table 2.

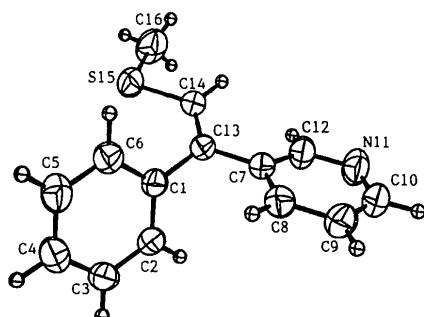

Fig. 1. ORTEP view of the title molecule showing the labelling of the non-H atoms. Thermal ellipsoids are shown at 50% probability levels. H atoms are displayed as isotropic spheres with B values of 1.0 \AA^2 .
