(Received 21 October 1991; accepted 27 April 1992)

Abstract. $C_{26}H_{22}O_2$, $M_r = 366.46$, monoclinic, $P2_1/n$, $a = 6.521$ (2), $b = 9.223$ (2), $c = 15.235$ (5) Å, $\beta = 91.91$ (3)°, $V = 915.8$ (8) Å³, $Z = 2$, $D_x = 1.33$ g cm⁻³, $\lambda(Mo K\alpha) = 0.71073$ Å, $\mu = 0.8$ cm⁻¹, $F(000) = 388$, room temperature, $R = 0.044$ for 1002 observed reflections. The relatively high density indicates the efficiency of the packing scheme, which is dominated by edge-to-face stacking of the aromatic moieties of the Z-shaped molecules.

Experimental. 5 α ,8 β ,14 β ,17 α -5,6,8,9,14,15,17,18-Octahydro-5,17:8,14-diepoxydibenzo[e,e']benzo[1,2-a:4,5-a']dicyclooctene (I), an analog of Kagan's ether (Kagan, Chen & Agdeppa, 1977), crystallizes as colorless plates, dimensions 0.10 × 0.20 × 0.35 mm.

Density not measured. Unit-cell parameters and intensity data obtained on an Enraf–Nonius CAD-4 diffractometer with graphite-monochromated Mo $K\alpha$ radiation in ω -2 θ mode ($0 < \theta < 23$ °). Cell dimensions refined by least-squares fitting of the θ values of 25 reflections with $10 < \theta < 15$ °. No significant drop in intensity of three standard reflections (234̄, 226 226̄) checked every 7200 s. 1400 total reflections measured in h , $k \pm l$ ranges, 0 to 0, -16 to 7 and 10 to 16, respectively; 1272 unique reflections, $R_{\text{int}} = 0.01$; 1002 reflections with $I \geq 2\sigma(I)$ used in subsequent calculations. Corrections applied for Lorentz and polarization effects but not for absorption. Structure solved by direct methods with *SHELXS86* (Sheldrick, 1985). H atoms located by ΔF synthesis and refined. Full-matrix least-squares refinement minimized $\sum w(|F_o| - |F_c|)^2$ with $w = 4F_o^2[\sigma^2(F) + (0.05F_o^2)^{-1}]$; anisotropic thermal parameters for C and O atoms and isotropic thermal parameters for H atoms. Final refinement with 171 parameters gave $R = 0.044$, $wR = 0.065$, $S = 2.00$ for observed data.

Table 1. Fractional atomic coordinates and equivalent isotropic thermal parameters (Å²) for non-H atoms with e.s.d.'s in parentheses

$$B_{\text{eq}} = (4/3)[a^2B(1,1) + b^2B(2,2) + c^2B(3,3) + ab(\cos\gamma)B(1,2) + ac(\cos\beta)B(1,3) + bc(\cos\alpha)B(2,3)].$$

Max. $\Delta/\sigma = 0.01$ in final cycle, max. residual density 0.18 e Å⁻³. Atomic scattering factors and anomalous-dispersion corrections from *International Tables for X-ray Crystallography* (1974, Vol. IV) and Enraf–Nonius (1982) SDP programs were used for all calculations.

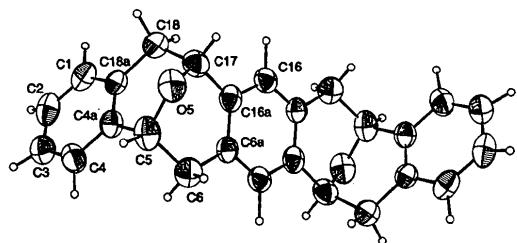

Fig. 1. Perspective view (*ORTEP*; Johnson, 1965) of the molecule giving the numbering scheme of the unique atoms. Thermal ellipsoids are drawn at the 50% probability level.

Table 1* gives the atomic coordinates and the molecular dimensions are given in Table 2. The atom-numbering scheme for the molecule, which lies on a center of symmetry, is given in Fig. 1. A stereoview of the packing scheme dominated by edge-face interactions of the aromatic rings is seen in Fig. 2.

Related literature. The title compound was prepared in the course of our work on molecular tweezers (Harmata & Barnes, 1990).

Abstract. α -(7-Chloro-1,3-dihydro-5-phenyl-2*H*-1,4-benzodiazepin-2-ylidene)-2,2,5,5-tetramethyl-1-aza-2,5-disilacyclopentane-1-acetic acid ethyl ester, $C_{25}H_{32}ClN_3O_2Si_2$, $M_r = 498.17$, triclinic, $P\bar{1}$, $a = 10.938$ (2), $b = 13.626$ (2), $c = 10.700$ (2) Å, $\alpha = 108.37$ (1), $\beta = 114.36$ (1), $\gamma = 73.79$ (1) $^\circ$, $V = 1358.1$ (4) Å 3 , $Z = 2$, $D_x = 1.218$ g cm $^{-3}$, m.p. 409–

411 K, $\lambda(\text{Cu } K\alpha) = 1.54178$ Å, $\mu = 23.16$ cm $^{-1}$, $F(000) = 528$, $T = 296$ K, $R = 0.056$, $wR = 0.076$ for 2495 unique reflections having $I > 3.00\sigma(I)$. The compound has *E* geometry at the exocyclic double bond. A disordered C-atom position in the 2,5-disilaazacyclopentane ring was identified. Internal hydrogen bonding of N(1)—H(1N) to the carbonyl
