Zr—O distances [1.959 (5)–1.976 (5) Å] as a result of partial double bonding.

Comment

Oxo complexes of zirconocene are of interest as intermediates in carbon monoxide and carbon dioxide fixation processes. Cp_2ZrO units are often found to be associated in trimeric molecules where Zr_3O_3 six-membered cycles are planar owing to additional $d_\pi-p_\pi$ interaction between O and Zr atoms. In previous studies, a toluene solvate of oxo-zirconocene trimer (I) was obtained via $\text{Cp}_2\text{Zr}(\text{CO})_2$ reaction with CO_2 and characterized by means of X-ray structure analysis (Fachinetti, Floriani, Chiesi-Villa & Guastini, 1979).

Abstract

The title compound, *cyclo*-tri- μ -oxo-tris[bis(η^5 -cyclopentadienyl)zirconium] benzene solvate, obtained from the reaction of zirconocene hydride with CO_2 , is shown to contain planar Zr_3O_3 cycles with comparatively short

Our investigations of carbon dioxide interaction with zirconocene and hafnocene hydrides have shown that $[\text{Cp}_2\text{ZrH}_2]_n$ readily reacts with CO_2 at room temperature and atmospheric pressure yielding the benzene solvate of the oxo-zirconocene trimer, (II). Its crystal structure was determined and compared with that of (I) and that of (η^2 -formaldehyde)zirconocene trimer (III) (Kropp, Skibbe & Erker, 1983), which turns into (II) on thermolysis.

Crystals of (II) consist of trimeric bis(cyclopentadienyl)oxozirconium complexes $[\text{Cp}_2\text{ZrO}]_3$ and solvating benzene molecules. The Zr_3O_3 cycle is planar within 0.023 Å; the Zr—O bond lengths range from 1.959 (5) to 1.976 (5) Å, which is almost the same as in (I) (1.950–1.968 Å) and significantly shorter than in (III) (2.133–2.178 Å). Rather short Zr—O bond distances in (μ -oxo)-complexes (I) and (II) result from the partial double bonding which is absent in (η^2 - CH_2O)-complex (III) and (μ -hydroxo)(μ_3 -oxo)cyclopentadienylzirconium complexes reported in recent publications (Babcock, Day & Klemperer, 1989; Thewalt, Döppert & Lasser, 1986). The three Zr—O—Zr angles [142.6 (2), 142.4 (1) and 142.1 (2)°] are almost equal and close to those observed in (I) (average

142.5°). Note that Zr—(μ-OH)—Zr angles in the above-mentioned hydroxocomplexes are significantly smaller (103.6°).

Planar Cp rings are η^5 -bonded to Zr atoms and Zr—Cp distances [2.275 (3)–2.290 (3) Å] fall in the range given for other ZrCp complexes (Fachinetti, Floriani, Chiesi-Villa & Guastini, 1979; Babcock, Day & Klempner, 1989). The Cp planes in the bent Cp₂Zr sandwiches in (II) form dihedral angles of 54.2 (3), 55.0 (3) and 55.6 (3)°, bisected by the Zr₃O₃-cycle mean plane.

Abstract

The coordination anions of the title compound $[Co(C_5H_5)_2][Ni(dmit)_2]$ are planar with a shuttle-shaped D_{2h} configuration. The cobaltocenium cations take an eclipsed D_{5h} conformation with an average Co—C distance of 2.037 (16) Å. The crystal consists of sheets of S···S connected anionic stacks with pairs of cations between them.

Comment

Since Steimecke, Sieler, Kirmse & Hoyer (1979) first prepared $(Bu_4N)_n[Ni(dmit)_2]$ ($n = 1, 2$), a great deal of attention has been directed to $Z_x[M(dmit)_2]$ type complexes ($M = Ni, Pd, Pt, Cu; H_2dmit = H_2C_3S_5 = 4,5\text{-dimercapto-1,3-dithiole-2-thione}; Z = \text{various cations}; 0 \leq x \leq 1$ or $x = 2$ because they are known to possess molecular electrical conductivity. $[M(dmit)_2]^{8-}$ has a planar structure with a delocalized electronic state; these anions may adhere together by means of intermolecular S···S interactions forming anionic stacks, sheets or even networks. They combine with various closed-shell counter ions or open-shell organic radicals to form conducting complexes such as superconductors $[(CH_3)_4N]_{0.5}[Ni(dmit)_2]$ (Kim, Kobayashi, Sasaki, Kato & Kobayashi, 1987) and $TTF_{0.5}[Ni(dmit)_2]$ (Bousseau, Valade, Legros, Cassoux, Garbauskas & Interrante, 1986). Metalloceniums have different tendencies to accept electrons and when they interact with $[Ni(dmit)_2]^-$ quite different compounds can be produced. The reaction of $(Bu_4N)[Ni(dmit)_2]$ and $[Fe(C_5H_5)_2]BF_4$ produces a completed charge-transfer semiconductor $[Ni(dmit)_2]$ (Fang, Li, Qu & You, 1992). However, the reaction of
