Abstract

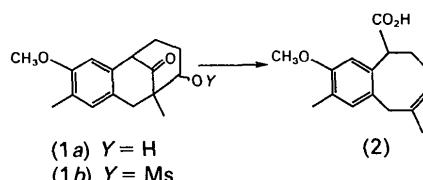

This X-ray diffraction study establishes the molecular structure of the title compound. The carbon skeleton of the molecule comprises a system of three six-membered rings, *A*, *B* and *C*; *A* is aromatic and almost planar. The *A* and *B* rings are *cis*-fused. The *A*, *B* and *C* rings adopt twist-chair ³T₁, envelope ⁶E and chair ⁴C₁ conformations, respectively. The *C* ring hydroxyl and methyl groups occupy axial and equatorial positions, respectively. The crystal structure is stabilized by an intermolecular hydrogen bond and two C—H···O hydrogen-bond interactions.

Comment

An important method for medium-size ring formation involves fragmentation (Grob & Schiess, 1967; Grob, 1969) of appropriately functionalized bicyclic systems. In our laboratory, the NaOH-induced fragmentation of the benzobicyclic ketomesylates (*1b*) were studied. Although both isomers gave the expected benzocyclooctene product (*2*), yields were strikingly different depending of the isomer used as starting material. Thus, the ketomesylate derived from the oily ketol isomer fragmented in nearly 90% yield, while the ketomesylate derived from the other (crystalline) ketol isomer proceeded in only about 40% yield.

In this paper, the stereochemistry of the OH group in the crystalline ketol (*1a*) has been established to be axial by X-ray crystal analysis. The oily ketol is the isomer with the equatorial OH, a result consistent

with a favourable antiperiplanar bonding arrangement for optimal fragmentation (Clayton, Henbest & Smith, 1957) in this isomer.

The *A* and *B* rings are *cis*-fused at the C(2)—C(7) bond and the *B* ring is fused at C(1)—C(13)—C(9) to the *C* ring. The ring-puckering parameters (Cremer & Pople, 1975) are $\varphi = -25$ (7), $\theta = 88$ (6) $^\circ$, $Q = 0.023$ (3) Å for *A*, $\varphi = -60.6$ (4), $\theta = 47.1$ (3) $^\circ$, $Q = 0.478$ (3) Å for *B*, and $\varphi = 68$ (6), $\theta = 2.8$ (3) $^\circ$, $Q = 0.584$ (3) Å for *C*, indicating twist-chair ³T₁, envelope ⁶E and chair ⁴C₁ conformations, respectively. The substituents at C(9) and C(10) are in equatorial and axial positions with torsion angles C(15)—C(9)—C(13)—C(1) = -179.8 (3) and O(2)—C(10)—C(11)—C(12) = -62.4 (4) $^\circ$, respectively. The crystal structure is stabilized by an intermolecular hydrogen bond between the O(2)—H hydroxyl group and the O(3) carbonyl group [O(2)—H···O(3)(0.5 + x , $-y$, z) 2.871 (4) Å] and two C—H···O interactions <3.5 Å [C(12)···O(2)($-x$, $-y$, 0.5 + z) 3.499 (6) and C(16)···O(3)(-0.5 - x , y , 0.5 + z) 3.435 (5) Å].

Data were corrected for Lorentz and polarization effects. The structure was solved by direct methods (*TEXSAN*; Molecular Structure Corporation, 1990). The H-atom positions in the CH, CH₂ and CH₃ groups were allowed to ride on the bonded C atoms and refined. The H atom bonded to the O atom was located on a difference Fourier map at an advanced stage of anisotropic refinement and its coordinates refined.

Abstract

The structure of 2,4,6-tri(*tert*-butyl)aniline is reported. The molecule lies on a crystallographic twofold axis.
