Abstract

The title molecule [alternative IUPAC names: 5,11,14-trichloro-4b,5,5a,10a,11,11a-hexahydro-10H-5,11-(methanonitrilo)indeno[2,1-*b*]fluorene or 1,11,22-trichloro-22-azahexacyclo[9.9.2.0^{2,10}.0^{3,8}.0^{12,20}.0^{14,19}]docosa-3(8),4,6,14(19),15,17,21-heptaene; C₂₁H₁₆Cl₃N] adopts a gull-wing shape and is orientated so that it is symmetric about a plane perpendicular to *c*. Both phenyl rings overlap those of neighbouring molecules *via* crystallographic inversion centres leading to π interactions, with nearest inter-ring C···C distances of 3.504 (8) and 3.795 (9) Å. As expected, the Cl—C bond to the *sp*² C atom is significantly shorter than those at the tetrahedral sites [1.729 (4) *cf.* 1.809 (4) and 1.771 (4) Å].

Comment

The structure determination reported herein forms part of a more general investigation into Diels–Alder additions

of mono- and di-olefins to trichloro-1,2,4-triazine. In contrast to the reactions of other mono-olefins reported previously, where a second addition occurs to only a limited extent (Barlow, Haszeldine & Simpkin, 1982), the title compound (1), the only product detected, results from two regioselective additions to indene (see below). The ¹H and ¹³C NMR data showed that the product was a symmetrical 2:1 adduct, but did not allow unequivocal differentiation between the two possible structures (1) and (2).

Experimental

A mixture of 3,5,6-trichloro-1,2,4-triazine (1.40 g, 7.6 mmol) and indene (6.12 g, 52.7 mmol) was sealed *in vacuo* in a Rotaflow tube (*ca* 50 ml) and heated at 343 K for 2 d. The volatile product was identified as nitrogen (0.14 g, 5.0 mmol, 70%) and the remaining material (7.32 g) was washed from the tube with dichloromethane and the solvent was then removed *in vacuo*. The residue was treated with diethyl ether (3 × 20 ml) and filtered. Removal of the solvent from the filtrate gave material (5.10 g) which was shown (IR) to be mainly unchanged indene; recrystallization of the precipitate (2.20 g) from chloroform gave the title compound (1) (2.06 g, 5.3 mmol, 70%; analysis found C 64.6, H 4.9, N 3.6, Cl 27.7%, M⁺ 387/389/391/393; analysis calculated for C₂₁H₁₆NCl₃ C 64.9, H 4.1, N 3.6, Cl 27.4%, M 387/389/391/393) as white crystals, m.p. 523–527 K.

Abstract

The title compound, $C_{26}H_{16}F_{24}N_4$, crystallizes as a racemic mixture with two crystallographically independent molecules in the asymmetric unit, which differ only slightly in conformation. In both cases, the central diazo region bears a close resemblance to the struc-
