Abstract

The configurations at the three chiral centres are *R*, *R* and *R*. The two substituents of the almost planar cyclopentanone are *trans* and the C2—C6—C10—C11 torsion angle is $-79(1)^\circ$.

Comment

During studies on new stereoselective approaches to the Prelog–Djerassi lactone and related compounds (Ouvrard, Rodriguez & Santelli, 1993), we found that the Carroll rearrangement of the substituted optically active β -ketoester (1), obtained from (+)-(2*R*)-(*R*)-pulegone, produced a good yield of the γ,δ -ethylenic ketone (2) as a crucial precursor of δ -lactones. Confirmation of the structure of (2) and determination of the stereochemistry of the rearrangement were achieved using the single-crystal X-ray analysis of the corresponding keto acid (3), easily obtained from (2) by oxidative cleavage of the double bond.

An intermolecular hydrogen bond exists between O12 and O4ⁱ [symmetry code: (i) $x - 1, y, z$]: O12—H4—O4ⁱ = 2.738 Å.

The structure was solved by direct methods using *SHELXS86* (Sheldrick, 1985). H atoms were placed in calculated positions, except for H(O4) which was found from difference Fourier maps. Anisotropic least-squares refinement was performed (*SHELX76*; Sheldrick, 1976); H atoms were treated isotropically with a common refined temperature factor ($U = 0.06 \text{ \AA}^2$).

Lists of structure factors, anisotropic displacement parameters, H-atom coordinates and complete geometry have been deposited with the British Library Document Supply Centre as Supplementary Publication No. SUP 71674 (12 pp.). Copies may be obtained through The Technical Editor, International Union of Crystallography, 5 Abbey Square, Chester CH1 2HU, England. [CIF reference: PA1054]

Abstract

The title tricyclic compound was obtained by photo-oxygenation of bis(5-formylfurfuryl) ether, followed by a dehydration reaction. The compound appears as a *trans* isomer, with respect to the relative positions of the lactonic rings to the dioxane ring, which remains chair shaped. Such a *trans* configuration has been found previously in anemonin, where the two lactonic rings are *trans* with respect to the cyclobutane ring.

Comment

It is known that the photo-oxygenation of furfural derivatives may give hydroxybutenolides (Bernaconi *et al.*, 1984; Cottier, Descotes, Nigay, Parron &
