Triphenyltin Iodide

SEIK WENG NG

Institute of Advanced Studies, University of Malaya, 59100 Kuala Lumpur, Malaysia

(Received 29 March 1994; accepted 1 November 1994)

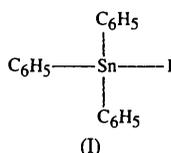

Abstract

The geometry at the Sn atom in iodotriphenyltin, $[\text{SnI}(\text{C}_6\text{H}_5)_3]$, is distorted tetrahedral.

Comment

The title structure completes the series of triphenyltin halide structures. Triphenyltin fluoride forms a polymeric chain structure [Sn—F 2.1458 (3) \AA] in which the five-coordinate Sn atom shows trigonal bipyramidal coordination (Tudela, Gutierrez-Puebla & Monge, 1992). Both triphenyltin chloride [Sn—Cl 2.354 (1) and 2.356 (1) \AA] (Tse, Lee & Gabe, 1986) and triphenyltin bromide [Sn—Br 2.495 (2) \AA] (Preut & Huber, 1979) adopt monomeric tetrahedral configurations. The iodide

[Sn—I 2.7081 (6) Å] also exists as a tetrahedral molecule and short intermolecular contacts are absent in the crystal structure. Bond dimensions in the present triphenyltin iodide, (I), do not differ significantly from those found in another triclinic modification [Sn—I 2.6916 (8) and 2.7060 (8) Å] in which there are two independent tetrahedral molecules in the unit cell (Simard & Wharf, 1994).

Although triphenyltin chloride forms a plethora of complexes with donor ligands, only a few complexes of the iodide have been reported and none has yet been structurally verified. The methyl-substituted iodide, tris(*p*-tolyl)tin iodide, forms a 1/2 adduct with 4,4'-bipyridine that displays an Sn—I bond distance of 2.830 (1) Å (Bajue, Bramwell, Charles, Cervantes-Lee & Pannell, 1992).

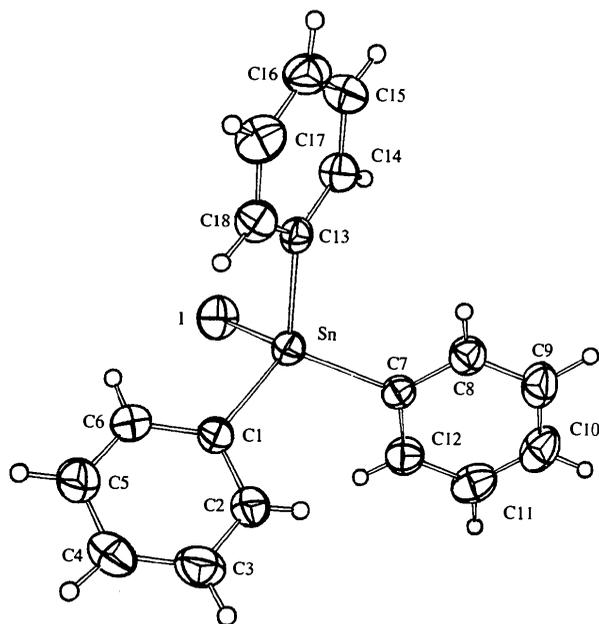

Fig. 1. ORTEP (Johnson, 1976) plot of triphenyltin iodide with displacement ellipsoids at the 30% probability level.

Experimental

Triphenyltin nicotinate (Ng, Kumar Das, van Meurs, Schagen & Straver, 1989) was treated with an excess of methyl iodide in ethanol in an attempt to synthesize the *N*-methylated nicotinate. Slow cooling of the filtered solution gave triphenyltin iodide instead. The compound is stable to light despite the presence of an Sn—I bond.

(Received 22 June 1994; accepted 24 October 1994)

Abstract

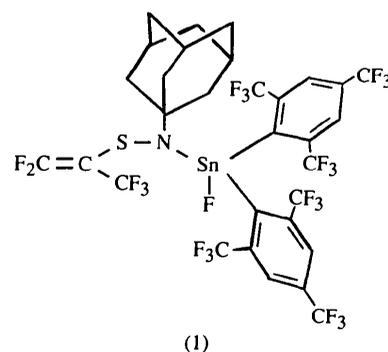

The synthesis and structure of the title compound (adamantane is tricyclo[3.3.1.1^{3,7}]decane), $[\text{SnF}(\text{C}_9\text{H}_2\text{F}_9)_2\{\text{C}_3\text{F}_5\text{S}(\text{C}_{10}\text{H}_{15}\text{N})\}]$, (1), are reported. (1) crystallizes as a monomer with short Sn...F interactions.

Comment

The title compound, (1), was synthesized by the reaction of hexafluoro-2-propanethione 1-adamantylimide with bis[2,4,6-tris(trifluoromethyl)phenyl]stannylene (Ahlemann, 1992):

$\text{R}_f = 2,4,6$ -Tris(trifluoromethyl)phenyl
Ad = Adamantyl

The Sn atom has a distorted tetrahedral environment. The Sn1—N1 [2.037(5) Å] and Sn1—F6 [1.938(3) Å] bonds are typical single bonds (Blom & Haarland, 1985). As a result of the different oxidation state of Sn, the Sn1—C distances [2.179(6) and 2.187(5) Å] are about 0.10 Å shorter than in bis[2,4,6-tris(trifluoromethyl)phenyl]stannylene [2.278(5) and 2.284(5) Å; Grützmacher, Pritzkow & Edelmann,
