Abstract

Two pseudosymmetrically related Ni^{II} complexes are located in the asymmetric unit of solid [Ni(C₁₄H₃₂N₄)]-(ClO₄)₂. The Ni²⁺ ion displays square-planar coordination with the four N atoms of the macrocyclic ligand. The quadridentate ligand adopts its stable conformation with two six-membered chelate rings in chair forms and two five-membered chelate rings in skew forms. The complex has a 1*RS*,4*RS*,8*SR*,11*SR* arrangement for the four chiral N-atom centres and a 5*SR*,7*RS*,12*RS*,14*RS* configuration for the four chiral C-atom centres.

Comment

According to a previous report (Hay, Jeragh, Ferguson, Kaitner & Ruhe, 1982), the reduction of *C-meso*-5,7,12,14-tetramethyl-1,4,8,11-tetraazacyclotetradeca-4,11-diene can give three diastereoisomeric tetraamines and their Ni^{II} complexes, in which the 1*RS*,4*RS*,8*SR*,11*SR* arrangement of the chiral N-atom centres should be as indicated by (I), (II) and (III). The crystal structure of the two isomers of the nickel(II)

complex, (I), with perchlorate has been reported (Hay *et al.*, 1982). This paper reports the crystallization and structure of complex (II).

Two molecules, *A* with coordinates (x_A, y_A, z_A) and *B* with coordinates near ($\frac{1}{2} - x_A, y_A, -\frac{1}{2} + z_A$), of the title complex cation are located in the asymmetric unit. The Ni²⁺ ion has square-planar coordination with the four N atoms of the macrocyclic ligand. These N atoms are coplanar within ± 0.054 (5) Å. The quadridentate ligand has the configuration 1*RS*,4*RS*,8*SR*,11*SR* for the four chiral N-atom centres. The two five-membered chelate rings are in skew forms and the two six-membered chelate rings are in chair forms. The Ni—N distances are close to the average Ni—N distance of 1.95 (4) Å for four-coordinate Ni^{II} macrocyclic complexes (Lu, Chung & Ashida, 1991). In both molecules *A* and *B* of the diastereoisomer (II) and in all three molecules of the diastereoisomer (I) (Hay *et al.*, 1982), the conformations of the 14-membered rings are similar.

All four perchlorate groups are disordered. The amino groups form hydrogen bonds with perchlorate O atoms.

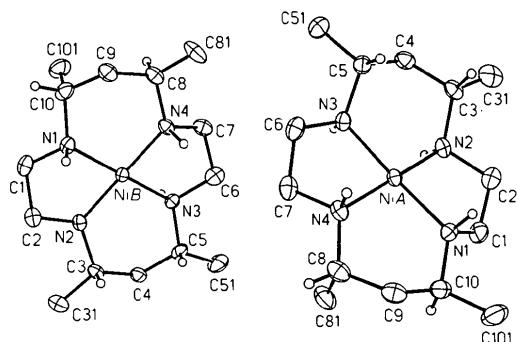

Fig. 1. A perspective view of the two crystallographically independent complex cations, *A* and *B*. The displacement ellipsoids are shown at the 50% probability level (Sheldrick, 1987). Perchlorate anions and selected H atoms are excluded for clarity.

Experimental

5,7,12,14-Tetramethyl-1,4,8,11-tetraazacyclotetradeca-4,11-diene dihydroperchlorate was prepared according to the reported method (Hay & Jeragh, 1977). The ligand contains two chiral C-atom centres. The preparation and separation of nickel(II) complexes of the two diastereoisomers, *C-meso*- and *C-rac*-5,7,12,14-tetramethyl-1,4,8,11-tetraazacyclotetradeca-

4,11-diene, were carried out as described by Kolinski & Korybut-Daszkiewicz (1975). (*C*-*meso*-5,7,12,14-Tetramethyl-1,4,8,11-tetraazacyclotetradeca-4,11-diene)nickel(II) diperchlorate (13 g) was dissolved in hot water (333 K) and NaBH₄ (2 g) and Na₂B₂O₇ (0.5 g) were added in small portions to the solution with vigorous stirring. On completion, the solution was heated under reflux for *ca* 4 h, acetone added (165 ml) and then filtered. The volume of the filtrate was reduced to *ca* 200 ml by rotatory evaporation and then allowed to stand at room temperature. A crop of red crystals was obtained and filtered off. The filtrate was adjusted to pH 8–9 with an aqueous solution of NaOH; on addition of Na₂C₂O₄, a purple precipitate was obtained. 0.6 g of the precipitate was dissolved in HClO₄ solution (15 ml 60% HClO₄ + 7.5 ml H₂O). Orange crystals formed on slow evaporation.

The structure was solved by direct and Fourier methods. Refinement was by full-matrix least-squares methods. H atoms were located by difference Fourier methods. *NRCVAX* (Gabe, Le Page, White & Lee, 1987) was used for all crystallographic computations.

The authors thank the National Science Council for support under grants NSC84-2112-M007-019 and NSC84-2113-M007-021. They are also indebted to Ms Shu-Fang Tung for collecting the X-ray diffraction data.

Lists of structure factors, anisotropic displacement parameters, H-atom coordinates, complete geometry and least-squares-planes data have been deposited with the IUCr (Reference: AB1193). Copies may be obtained through The Managing Editor, International Union of Crystallography, 5 Abbey Square, Chester CH1 2HU, England.

Abstract

The title molecule, [Cu₂(C₆H₅COO)₄(C₁₀H₁₄N₂O)₂], is a crystallographically centrosymmetric binuclear complex, with Cu atoms [Cu···Cu' = 2.613 (1) Å] bridged by four benzoate ligands. The four nearest O atoms around each Cu atom form a square-planar arrangement with the square-pyramidal coordination completed by the pyridine N atom of the *N,N*-diethylnicotinamide ligand at a distance of 2.162 (6) Å. Each Cu atom is displaced by 0.190 (1) Å from the plane of the four O atoms, with an average Cu—O distance of 1.974 (6) Å.

Comment

N,N-Diethylnicotinamide (DENA) is known as an important respiration stimulant. The structures of some complexes obtained from the reactions of transition metal(II) ions with DENA have been determined previously: Cd(DENA)(SCN)₂ (Bigoli, Braibanti, Pellinghelli & Tiripicchio, 1972), Mn(DENA)₂(NCS)₂ (Bigoli, Braibanti, Pellinghelli & Tiripicchio, 1973a), Zn(DENA)₂(NCS)₂(H₂O)₂ (Bigoli, Braibanti, Pellinghelli, 1973b). In Mn(DENA)₂(NCS)₂, DENA is a bidentate ligand, bonded to the metal atom through the pyridine N and amide O atoms. Alternatively, in Cd(DENA)(SCN)₂ and Zn(DENA)₂(NCS)₂(H₂O)₂, DENA is a monodentate ligand coordinated through only the pyridine N atom, which is more basic than the O atom. The title compound, (I), is a binuclear com-
