The positions of the H atoms of (1) could be found from difference Fourier maps, but refinement resulted in slightly deformed arrangements. Thus, for final refinement, H atoms were set at calculated positions [except for H(N)].

Data collection and cell refinement were carried out with CAD-4 EXPRESS (Enraf–Nonius, 1993). All calculations were performed with SHELXS86 (Sheldrick, 1985) and SHELXL93 (Sheldrick, 1993). Molecular graphics were obtained with SCHAKAL92 (Keller, 1992).

SP thanks the Studienstiftung des deutschen Volkes for a doctoral fellowship.

Lists of structure factors, anisotropic displacement parameters, H-atom coordinates and complete geometry have been deposited with the IUCr (Reference: JZ1075). Copies may be obtained through The Managing Editor, International Union of Crystallography, 5 Abbey Square, Chester CH1 2HU, England.

Abstract

Crystals of the title compound, 1,5-diphenylbiuret-*N*-cyano-*N'*-phenylurea (1/1), $C_{14}H_{13}N_3O_2 \cdot C_8H_7N_3O$, were obtained from both ethanol and ethyl acetate solutions of phenyl carbamidonitrile. The structure of the complex features pairs of diphenylbiuret and phenyl carbamidonitrile molecules linked by hydrogen bonds. Excluding a tilted phenyl group, the molecule of 1,5-diphenylbiuret has a large, approximately coplanar, fragment in which all C—N bonds are partial double bonds.

Comment

In the course of our research on the relationship of the structure and properties of conjugated polynitriles, the monomeric structure of phenyl carbamidonitrile, (I), has been reported (Yang, Huang, Chen & Tang, 1995). While growing the crystals of (I) from both ethanol and ethyl acetate solutions of (I), we accidentally obtained crystals of a 1:1 complex of (I) with 1,5-diphenylbiuret, (II). It appears that a condensation-like reaction occurred in the solution. The melting point of the 1:1 complex (439–442 K) is much higher than the melting point of (I) (405–407 K).

The structure of the 1:1 complex contains pairs of molecules of (I) and (II) linked by hydrogen bonds, as shown in Fig. 1. The conformation of the molecule of (I) is similar to that found in pure phenyl carbamido-nitrile (Yang, Huang, Chen & Tang, 1995), with a nearly planar carbamidonitrile group (mean deviation 0.08 Å). The dihedral angle between the phenyl ring and the plane of the carbamidonitrile group is 30.5°. Except for the C(11)—N(12) nitrile bond, the C—N bonds in the molecule of (I) are partial double bonds (Gilli, Bertolasi, Bellucci, Fabrizio & Ferretti, 1986) ranging from 1.286(3) to 1.408(3) Å. Both N(7) and N(10) are *sp*²-hybridized.

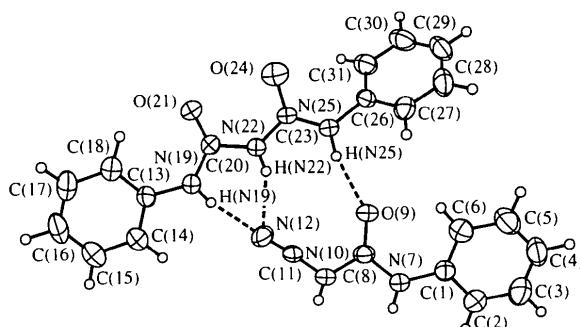

Fig. 1. The structure of the title complex with the atom-labelling scheme. Displacement ellipsoids are shown at the 50% probability level for non-H atoms; H atoms are shown as spheres of arbitrary radii.

The molecule of (II) adopts an extended conformation and contains an approximately coplanar fragment consisting of 13 atoms from C(13) to N(25) [mean deviation from best plane 0.08 Å; maximum deviation for N(25) 0.23 Å]. The C—N bond lengths in the fragment [1.324(3)–1.414(3) Å] are also in the range expected for partial double C—N bonds. This indicates that there is a large delocalized π -electron system through the 13 atoms. The second phenyl ring in the molecule of (II) is tilted by 62.4° with respect to the large planar fragment, to which it is connected by a single C(26)—N(25) bond of length 1.431(3) Å.

Intermolecular hydrogen bonds connect the nitrile N atoms and the carbonyl O atoms of each molecule of (I) (as acceptors) with the N atoms of the nearest molecule of (II) (as donors), forming 1:1 molecular pairs. These, in turn, pack with van der Waals' interactions in the crystal. It is thought that the *cis* conformation of the two carbonyl groups in the molecule of (II) is due to the intermolecular hydrogen bond shown in Fig. 1. The dihedral angle between the phenyl rings C(1)–C(6) and C(13)–C(18) in each pair is only 13.5°.

Experimental

The title crystals can be obtained from ethanol or ethyl acetate solutions of phenyl carbamidonitrile by the vapour-diffusion method with a pentane precipitant.

(Received 23 May 1995; accepted 19 September 1995)

Abstract

Lithium indene reacts with *N-p-toluenesulfonylaziridine* to yield *N-[2-(1-3H-indenyl)ethyl-p-toluenesulfonamide*, $C_{18}H_{19}NO_2S$. The structure consists of independent molecules with the indene group substituted at the expected 1 position of the five-membered ring. The sulfonamide moiety has a planar arrangement about the N atom.

Comment

The current interest in bidentate cyclopentadiene alkoxides and amides as ligands (Hughes, Meetsma & Teuben, 1993) for early transition metals prompted us to investigate the synthesis of molecules of this type via the reaction of cyclopentadienyls with aziridines. The title compound, (I), was prepared by the reaction of the indenyl anion with *N-p-toluenesulfonylaziridine*. An analogous reaction has been described for the substitution of epoxides with fluorenyl or cyclopentadienyl to yield cyclopentadiene alkoxides (Rieger, Steimann & Fawzi, 1992).

The structure of (I) (Fig. 1, Table 1) shows it to be a 1,2-disubstituted ethane with a regular indenyl moiety substituted at the C atom in position 1 of the five-membered ring and having the double bond in the 1 position [$C1=C2$ 1.340 (4) \AA], as expected from NMR evidence. The sulfonamido moiety displays a basically planar N atom, with the bound H atom 0.25 (3) \AA from the plane through atoms S1, N1, C10; the closest intermolecular contact is 2.23 \AA for O2…H1(N1). Only C2 is significantly out of the indenyl plane [0.023 (4) \AA]; there is an angle of 40.2 (1) $^\circ$ between this and the plane of the toluene moiety. There are no significant deviations from expected bond lengths and angles in the molecule (*International Tables for Crystallography*, 1992, Vol. C, Table 9.5.1.1).
