

polarization effects, but not for absorption. The scan speed was  $3\text{--}12^\circ \text{ min}^{-1}$  with width  $(1.2 + 0.14\tan\theta)^\circ$ . The structures were solved by direct methods and refined by anisotropic full-matrix least squares. All the H atoms were found from  $\Delta\rho$  maps and refined isotropically.

## 2,3,6,7-Tetrakis(methylthio)benzo[*b*]thiophene

M. PARVEZ,\* S. T. E. MESHER AND P. D. CLARK

Department of Chemistry, The University of Calgary, 2500 University Drive NW, Calgary, Alberta, Canada T2N 1N4.

(Received 21 July 1995; accepted 17 November 1995)

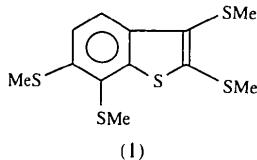

## Abstract

Crystals of the title compound,  $C_{12}H_{14}S_5$ , are composed of independent molecules separated by normal van der Waals distances. The benzothiophene moiety is essentially planar and substituted by four methylthio groups, two of which, those at positions 2 and 6, lie almost in the plane, with the remaining two, those at positions 3 and 7, lying almost perpendicular to the plane. The mean values of the important bond distances are  $S—C_{sp^3}$  1.805 (17) and  $S—C_{sp^2}$  1.767 (19) Å.

## Comment

The one-step thioalkylation of heteroaromatic compounds is a desirable process as it can lead to the for-

mation of heteroaromatic thiols by reduction of the S atom. Our experiments involving benzo[*b*]thiophene and excess methyl disulfide yielded the title compound, (1), as a yellow solid. An X-ray identification of (1) was needed as the 2,3,4,5-tetrakis(methylthio) and 2,3,6,7-tetrakis(methylthio) compounds would give similar <sup>1</sup>H and <sup>13</sup>C spectra. The present report describes the crystal structure of compound (1).

An ORTEPII diagram (Johnson, 1976) of (1) is presented in Fig. 1, along with the atomic numbering scheme. The molecular dimensions in the benzothiophene moiety involving C atoms are normal with mean bond distances C—C<sub>aromatic</sub> 1.38 (3), C<sub>sp<sup>2</sup></sub>—C<sub>sp<sup>2</sup></sub> 1.440 (12) and C=C 1.353 (12) Å, while the S—C<sub>sp<sup>2</sup></sub> distances of 1.757 (9) and 1.733 (8) Å are significantly longer than those reported for 2,3-bis(ethylsulfonyl)-benzo[*b*]thiophene [mean 1.725 (1) Å] (Parvez, Mesher & Clark, 1996). The remaining S—C distances, with mean values for S—C<sub>sp<sup>2</sup></sub> and S—C<sub>sp<sup>3</sup></sub> of 1.767 (19) and 1.805 (17) Å, respectively, are normal (Allen *et al.*, 1992). The benzothiophene moiety is essentially planar within experimental error, with a maximum deviation of 0.019 (12) Å for the C7a atom. There are four methylthio groups attached to the benzothiophene moiety, two of which, those at positions 2 and 6, are almost coplanar with it; the dihedral angles between the benzothiophene plane and these groups are 7.9 (8) and 6.5 (9)°, respectively. The methylthio groups at positions 3 and 7 are almost perpendicular to the benzothiophene

plane, with dihedral angles of 96.7 (8) and 80.7 (8)°, respectively.

The crystal structure of (1) is composed of discrete molecules separated by normal van der Waals distances.

## Experimental

The title compound was prepared as previously described by Clark, Mesher & Primak (1996). Crystals were obtained as yellow plates by evaporation from a solution of hexanes/THF (95:5).

### Crystal data

(Received 29 June 1995; accepted 9 November 1995)

## Abstract

In the title compound,  $(\text{C}_6\text{H}_5)(\text{NC}_4\text{H}_8)[\text{N}(\text{C}_6\text{H}_{11})_2]\text{PN}-(\text{S}_3\text{N}_3)$ , the cyclotrithiazene ring adopts a distorted-chair conformation. The tricoordinated S atom has a maximum deviation of 0.658 (6)  $\text{\AA}$  from the mean plane of the other five atoms of the  $\text{S}_3\text{N}_3$  ring.

## Comment

Very few crystal structure data on monosubstituted cyclotrithiazene derivatives are available (Chivers, Oakley, Cordes & Pennington, 1981; Elias, Sudheendra Rao & Varghese, 1990; Holt & Holt, 1974; Holt, Holt & Watson, 1977). Phosphiniminocyclotrithiazenes, which are examples of 8 $\pi$ -electron systems, provide an opportunity to study experimentally the effects of varying the substituents attached to phosphorus on the bonding pattern and the conformation of the heterocycle. A detailed and systematic investigation has been undertaken and the present work on the title compound, (I), forms a part of this study.
