(Received 11 December 1995; accepted 14 March 1996)

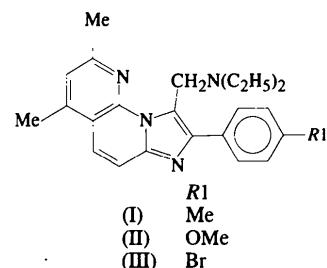

Abstract

The structures of three 1,2,6,8-tetrasubstituted imidazonaphthyridine derivatives, 1-diethylaminomethyl-6,8-dimethyl-2-(4-methylphenyl)imidazo[1,2-*a*][1,8]naphthyridine, (VII), 1-diethylaminomethyl-2-(4-methoxyphenyl)-6,8-dimethylimidazo[1,2-*a*][1,8]naphthyridine, (VIII), and 2-(4-bromophenyl)-1-diethylaminomethyl-6,8-dimethylimidazo[1,2-*a*][1,8]naphthyridine, (IX), are reported. Two molecules related by a pseudo inversion centre are present in the asymmetric unit of (IX). Intramolecular

C—H···N hydrogen bonds are observed in (VII) and (IX) whereas an intermolecular C—H···O hydrogen bond is present in (VIII).

Comment

We continue our reports of the crystal structures of imidazonaphthyridine compounds (Fun *et al.*, 1996; Sivakumar *et al.*, 1996) with those of three 1,2,6,8-tetrasubstituted imidazonaphthyridine compounds, (VII), (VIII) and (IX). All three compounds were prepared by the Mannich reaction (Chua & Jackson, 1995). The bond lengths and angles observed in these structures (Table 2) are normal and comparable with those observed in other imidazonaphthyridine derivatives. However, the orientations of the phenyl rings and of the diethylaminomethyl groups show some differences in the three compounds.

In (IX) two molecules are present in the asymmetric unit and are related by a pseudo inversion centre at (0.22, 0.50, 0.25). The diethylaminomethyl groups in the two molecules (IXA) and (IXB) lie on opposite sides of the imidazonaphthyridine plane (see the relevant torsion angles in Table 2). The dihedral angles between the planes of the imidazonaphthyridine moiety and the phenyl ring are 15.66(4), 29.07(3), 20.6(1) and 17.1(1)° in (VII), (VIII), (IXA) and (IXB), respectively. In (VII), (IXA) and (IXB), the orientation of the diethylaminomethyl group is favourable for intramolecular C12—H12···N4 hydrogen bonding whereas in (VIII) the orientation of this group is entirely different and an intermolecular C—H···O hydrogen bond involving the O1 methoxy atom is observed instead. Hydrogen-bond details: in (VII) C12···N4 3.258(2) Å, C12—H12···N4 151(2)°; in (VIII) C18···O1ⁱ 3.473(3) Å, C18—H18A···O1ⁱ 154(3)°; in (IX) C12A···N4 3.258(8) Å, C12A—H12A···N4 154(4)°, C12B···N4B 3.270(8) Å, C12B—H12B···N4B, 152(4)° [symmetry code: (i) 1-*x*, 1-*y*, 1-*z*]. The planar imidazonaphthyridine moieties stack parallel to the (2̄2̄) planes (spacing 3.412 Å) in (VII), to (20̄2) (spacing 3.351 Å) in (VIII), and to (004) (spacing 3.443 Å) in (IX). In all three structures, the packing involves intermolecular π-π interactions.

In 2,6,8-trisubstituted imidazonaphthyridine derivatives, the molecules readily form dimers through C2—H2···N1 bonds (Fun *et al.*, 1996; Sivakumar *et al.*,

1996). The present study shows that the additional substitution of a diethylaminomethyl group at C9 sterically hinders such dimer formation.

Experimental

Single crystals of (VII), (VIII) and (IX) were obtained by slow evaporation of ethyl acetate solution of the compound.

All H atoms except those attached to C21 in (IXA) and (IXB) were located from difference maps and refined isotropically. Those attached to C21A and C21B were geometrically fixed and allowed to ride.

For all compounds, data collection: *XSCANS* (Siemens, 1994); cell refinement: *XSCANS*; data reduction: *XSCANS*; program(s) used to solve structures: *SHELXTL/PC* (Sheldrick, 1990) (direct methods); program(s) used to refine structures: *SHELXL93* (Sheldrick, 1993); molecular graphics: *SHELXTL/PC*; software used to prepare material for publication: *SHELXL93, PARST* (Nardelli, 1983).

Abstract

The crystal structures $C_{18}H_{12}Cl_3P$ (1) and $C_{18}H_{12}F_3P$ (2) have been determined. In (1) the average P—C distance and C—P—C angle are 1.834 (2) Å and 101.9 (1)°, respectively, while in (2) they are 1.825 (5) Å and 102.5 (2)°. Intermolecular C—H···F hydrogen bonds are observed in (2).

Comment

There have been numerous X-ray structural determinations of tertiary phosphines, PR_3 , which are widely used as ligands in organo-transition-metal chemistry. However, a search of the October 1995 release of the Cam-

† On leave from: Department of Physics, Anna University, Madras-600 025, India.

bridge Crystallographic Database (Allen, Kennard & Taylor, 1983) revealed only ten entries for organometallic complexes containing the ligand (1), 16 entries for complexes of (2), and no reports on the structures of the free ligands. As part of our study of substitution of metal carbonyls by group 15 ligands, we have previously determined the structures of several tertiary phosphine ligands (Shawkataly, Chong, Fun & Sivakumar, 1996; Shawkataly, Sivakumar & Fun, 1996). We now report the structures of (1) and (2).

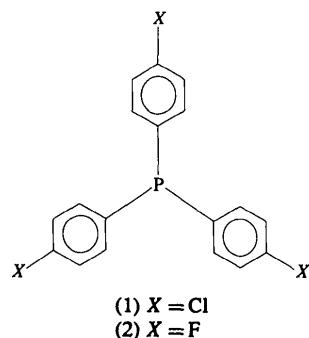

Fig. 1 shows the displacement-ellipsoid plots of the molecules of (1) and (2) with the numbering scheme. Both compounds have the expected geometry whereby the P atom is three coordinate with P—C(Ph) bonds folded back from the lone-pair site, giving a slightly distorted tetrahedral geometry and C—P—C angles less than 109.5°.

In (1) and (2) the mean P—C bond lengths of 1.834 (2) and 1.825 (5) Å are comparable with values of 1.828 (3) and 1.831 (2) Å reported for PPh_3 (Dunne & Orpen, 1991; Daly, 1964) and with the mean value of 1.828 Å for 2239 transition-metal complexes containing PPh_3 (Orpen *et al.*, 1989). The P—C distance in (2), however, is shorter than the corresponding distance of 1.835 (2) Å in *cis*-[Mo(CO)₄*L*]₂, *L* = (2), which has significant Mo—P back bonding (Alyea, Ferguson, Gallagher & Song, 1994). While there are no appreciable differences between the three P—C bond lengths in (1), their variation in (2) may be significant. In (1) and (2) the mean C—P—C bond angles are 101.9 (1) and 102.5 (2)°, respectively. Since both structures were determined at room temperature, a detailed description of the distortion of the phenyl rings (see Domenicano, Vaciago & Coulson, 1975) is not presented. The dihedral angles between the planes of the phenyl rings are 129.40 (7), 92.57 (7) and 66.31 (7)° for (1) and 84.1 (2), 85.0 (2) and 93.6 (2)° for (2). In general, the dihedral angles in PPh_3 and other substituted PPh_3 structures are within 20° of 90° but in (1), an abnormal deviation of 40° is observed.

There are no short contacts observed in (1) but in (2) five possible intermolecular C—H···F hydrogen bonds attributable to the high electronegativity of fluorine have been observed (see Table 5).
