the cation is coordinated in an octahedral manner by six aqua ligands [Co—O 2.078 (2)–2.124 (2) Å]. The crystal structure is stabilized by extensive hydrogen bonding. Each aqua ligand forms two donor hydrogen bonds with the carboxyl O atoms from adjacent anions and the hydroxyl group forms a hydrogen bond with an adjacent carboxyl O atom.

## Comment

2-Hydroxy-1,3-propanediamine-*N,N,N',N'*-tetraacetic acid ( $H_4\text{hppta}$ ) is a structural analogue of the widely used chelate ligand ethylenediamine-*N,N,N',N'*-tetraacetic acid. Hence, it is somewhat surprising that metal complexes of  $H_4\text{hppta}$  have received little attention. Only a few metal complexes of hppta have been structurally characterized, including two cobalt(III) complexes (Kalina, Pavelčík & Majer, 1978; Sato & Yano, 1989) and one palladium(II) complex (Song, Zhang, Li, Jin & Jin, 1992). In this paper, we report the preparation and structure of a mixed-valent cobalt complex of hppta, namely  $[\text{Co}(\text{H}_2\text{O})_6][\text{Co}(\text{hppta})]_2$ , (I). The complex was obtained from a mixture of  $\text{Co}(\text{NO}_3)_2$  and  $H_4\text{hppta}$  in a weakly acidic aqueous solution.

### Abstract

The structure of the title complex,  $[\text{Co}(\text{H}_2\text{O})_6][\text{Co}(\text{C}_{11}\text{H}_{14}\text{N}_2\text{O}_9)]_2$ , is comprised of discrete  $[\text{Co}(\text{hppta})]^-$  anions ( $H_4\text{hppta}$  is 2-hydroxy-1,3-propanediamine-*N,N,N',N'*-tetraacetic acid) and  $[\text{Co}(\text{H}_2\text{O})_6]^{2+}$  cations in a 2:1 molar ratio. The trivalent Co atom in the anion is coordinated by the hexadentate hppta chelate ligand, with two amino-N atoms [Co—N 1.948 (3) Å] and four O atoms of the four monodentate carboxylato groups [Co—O 1.869 (2)–1.914 (2) Å] in a distorted octahedral arrangement, with the most distorted bond angle being N1—Co1—N2 at 97.7 (1)° (Fig. 1). The bond lengths and angles of this anion are strikingly similar to those of the cobalt(III) complexes of hppta reported previously (Kalina, Pavelčík & Majer, 1978; Sato & Yano, 1989). It is noteworthy that the Co1—O8 [1.869 (2) Å] and Co1—O4 [1.894 (2) Å] bonds are significantly shorter than the Co1—O2 [1.904 (2) Å] and Co1—O6 [1.914 (2) Å] bonds, which are *trans* with respect to the Co—N bonds, demonstrating clearly that nitrogen has a much greater *trans* effect than oxygen. In the  $[\text{Co}(\text{H}_2\text{O})_6]^{2+}$  cation, the Co<sup>II</sup> atom is located at an inversion centre and is surrounded by six centrosymmetrically related aqua ligands [Co—O 2.078 (2)–2.124 (2) Å] in a slightly distorted octahedral

crystal structure of the mixed-valent complex comprises discrete  $[\text{Co}(\text{H}_2\text{O})_6]^{2+}$  cations and  $[\text{Co}(\text{hppta})]^-$  anions in a 1:2 molar ratio. The Co<sup>III</sup> atom in the anion is coordinated by a hexadentate hppta chelate ligand, being surrounded by two N atoms [Co—N 1.948 (3) Å] and four O atoms from the four monodentate carboxylato groups [Co—O 1.869 (2)–1.914 (2) Å] in a distorted octahedral arrangement, with the most distorted bond angle being N1—Co1—N2 at 97.7 (1)° (Fig. 1). The bond lengths and angles of this anion are strikingly similar to those of the cobalt(III) complexes of hppta reported previously (Kalina, Pavelčík & Majer, 1978; Sato & Yano, 1989). It is noteworthy that the Co1—O8 [1.869 (2) Å] and Co1—O4 [1.894 (2) Å] bonds are significantly shorter than the Co1—O2 [1.904 (2) Å] and Co1—O6 [1.914 (2) Å] bonds, which are *trans* with respect to the Co—N bonds, demonstrating clearly that nitrogen has a much greater *trans* effect than oxygen. In the  $[\text{Co}(\text{H}_2\text{O})_6]^{2+}$  cation, the Co<sup>II</sup> atom is located at an inversion centre and is surrounded by six centrosymmetrically related aqua ligands [Co—O 2.078 (2)–2.124 (2) Å] in a slightly distorted octahedral

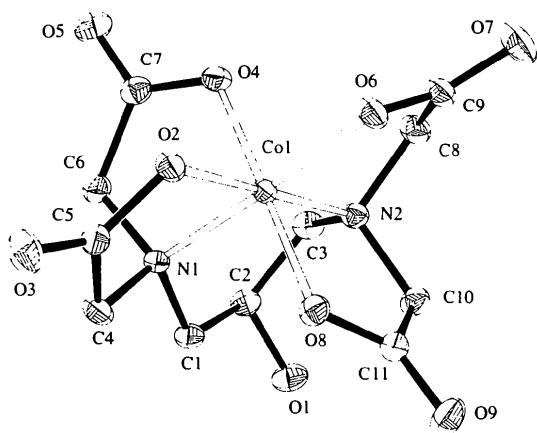

Fig. 1. An ORTEP (Johnson, 1965) plot (30% probability) of the  $[\text{Co}(\text{hpdta})]^-$  anion.

arrangement, where the most distorted bond angle is O1W—Co2—O2W at  $93.34(9)^\circ$ . The geometry of this cation is similar to those of  $[\text{M}(\text{H}_2\text{O})_6]^{2+}$  ( $\text{M} = \text{Zn}, \text{Mn}$ ; Auerbach, Stockheim, Weyhermüller, Wieghardt & Nuber, 1993).

Hydrogen bonding plays a vital role in stabilizing the crystal structure. The hydroxyl group forms a donor hydrogen bond with a carboxyl O atom [ $\text{O}1 \cdots \text{O}9$  2.912 (4) Å] from an adjacent anion. Each aqua ligand also forms two donor hydrogen bonds [ $\text{O} \cdots \text{O}$  2.703 (3)–2.782 (4) Å] with carboxyl O atoms from adjacent anions, resulting in each  $[\text{Co}(\text{H}_2\text{O})_6]^{2+}$  cation forming 12 donor hydrogen bonds with six adjacent

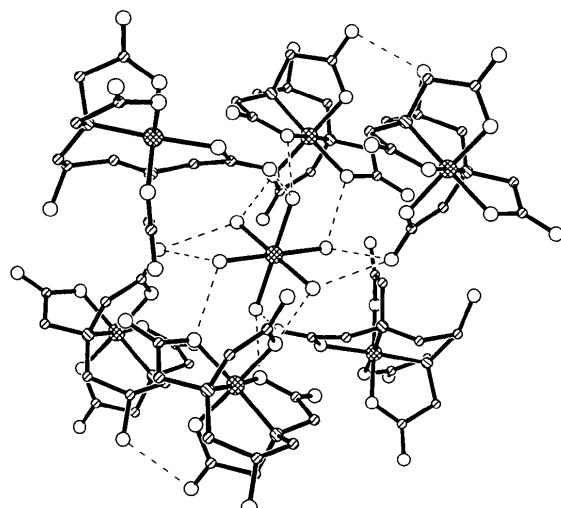

Fig. 2. Perspective view showing the hydrogen-bonding scheme. The cross-hatched circles, open circles, bottom left-to-top right lined circles and bottom right-to-top left lined circles represent the Co, O, N and C atoms, respectively.

$[\text{Co}(\text{hpdta})]^-$  anions (Fig. 2). Extensive hydrogen bonding similar to that in the title complex has been found in metal complexes containing analogous  $[\text{M}(\text{H}_2\text{O})_6]^{2+}$  cations ( $\text{M} = \text{Zn}, \text{Mn}$ ; Auerbach, Stockheim, Weyhermüller, Wieghardt & Nuber, 1993). The hydrogen bonds in the title complex extend the structure into two-dimensional layers parallel to the  $yz$  plane.

Finally, it is noteworthy that complexes containing  $[\text{Co}(\text{hpdta})]^-$  anions were commonly prepared by oxidation of  $\text{Co}^{\text{II}}$  ions with hydrogen peroxide. In contrast, the title complex was prepared by auto-oxidation of  $\text{Co}^{\text{II}}$  with air in a weakly acidic aqueous solution (pH 5).

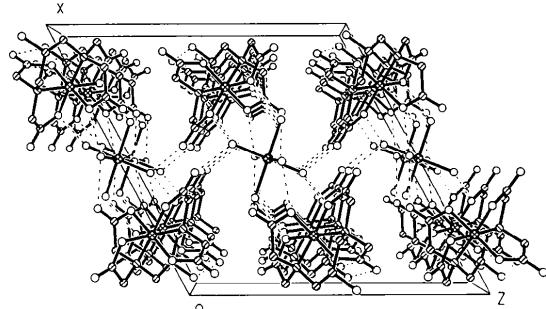

Fig. 3. The molecular packing of the title complex in the lattice.

## Experimental

An aqueous solution (2 ml) of  $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$  (0.29 g, 2.0 mmol) was added to an aqueous solution (8 ml) of  $\text{H}_{\text{4}}\text{hppta}$  (0.51 g, 1.0 mmol). The mixture was heated at 323 K, stirred for 10 min and the resulting solution adjusted to pH 5 with an aqueous solution of 2 N NaOH and allowed to stand in air. Reddish brown crystals of the title compound were deposited after a week.
