Tetramethylammonium Hydrogen Bis[bis(dimethyldithiocarbamyl)acetate]†

SEIK WENG NG

^a*Institute of Postgraduate Studies and Research, University of Malaya, 50603 Kuala Lumpur, Malaysia. E-mail: h1nswen@cc.um.edu.my*

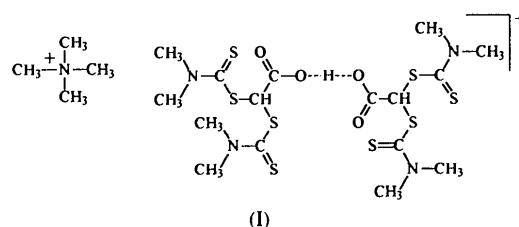

(Received 24 June 1996; accepted 14 March 1997)

Abstract

The two carboxylato anions in the title compound, $\text{C}_4\text{H}_{12}\text{N}^+ \cdot \text{C}_{16}\text{H}_{27}\text{N}_4\text{O}_4\text{S}_8^-$, are linked through an H atom which lies on a center of inversion [O···O 2.484 (3) Å].

Comment

In an earlier study, the C—O and C=O bonds [1.232 (2)–1.241 (3) Å] of the —CO₂ group in both independent ion pairs of dicyclohexylammonium bis(*N,N*-dimethyldithiocarbamyl)acetate were found to be indistinguishable from one another (Ng, 1996). The anions are linked through the ammonium N atom across a center of inversion into a dimeric ion pair having an O—C—O···N···O—C—O···N ring. Such hydrogen bonding through N atoms is not possible with the title compound, (I), which crystallizes with a neutral acid molecule.

† Alternative name: tetramethylammonium hydrogen bis[*bis(N,N*-dimethyldithiocarbamoylthio)acetate].

The carboxylato anion and the neutral acid molecule are linked through the acidic H atom [O \cdots O 2.486(3) Å]. The hydrogen-bond distance is similar to that [O \cdots O 2.448(3) Å] found in bis(dicyclohexylammonium) trithiocarbodiglycolate trithiocarbodiglycolic acid (Ng, 1995); this compound also has its anionic entity hydrogen bonded to an acid molecule.

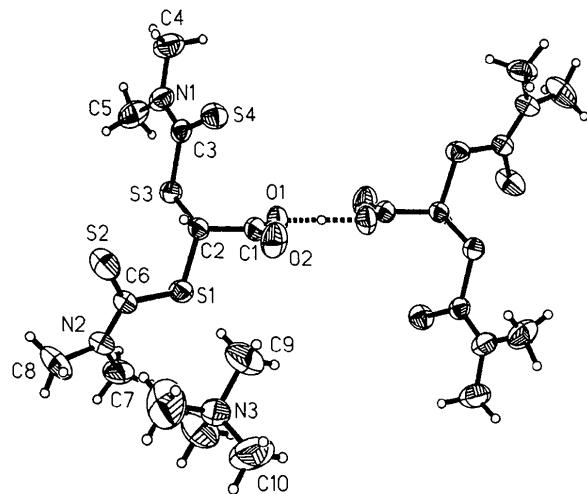

Fig. 1. ORTEPII (Johnson, 1976) plot at the 50% probability level. H atoms are drawn as spheres of arbitrary radii.

Experimental

Equimolar quantities of bis(*N,N*-dimethyldithiocarbamyl)-acetic acid (Pluijgers & van der Kerk, 1961) and tetramethylammonium hydroxide were dissolved in a small volume of hot ethanol. The title compound separated on slow evaporation of the solvent.

(Received 23 December 1996; accepted 20 March 1997)

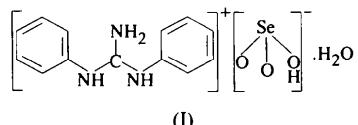

Abstract

In the crystal structure of the title compound, $C_{13}H_{14}N_3^+ \cdot HSeO_3^- \cdot H_2O$, the phenyl rings lie *syn* to the

unsubstituted N atom of the cation and the geometry of the guanidinium group is close to that expected for a central C_{sp^2} atom. The crystal packing is stabilized by an extensive network of hydrogen bonds. The anion is an acceptor of the N—H guanidinium groups and the water molecule forms a four-membered hydrogen-bonded ring with the anion.

Comment

The title compound belongs to a series of new selenite compounds of organic moieties synthesized as part of a project to study new materials with potentially interesting optical and dielectric properties (de Matos Gomes *et al.*, 1995; Paixão *et al.*, 1997). Selenite compounds are particularly interesting due to the fact that they often exhibit ferro- or antiferroelectric properties and structural phase transitions at low temperature associated with the onset of the polar phases, as found in the alkali trihydrogenseselenites (Shulalov, Ivanov, Gordeeva & Kirpichnikova, 1970). Phase transitions have been observed in the novel compound benzyltrimethylammonium trihydrogen selenite (de Matos Gomes *et al.*, 1995), but DSC measurements failed to show any peculiar feature for the present compound while cooling from room temperature down to 233 K.

The $HSeO_3^-$ ion is pyramidal with two shorter Se—O bonds [1.649 (2) and 1.665 (2) Å] and one longer Se—OH bond [1.768 (2) Å]. The average value of an Se—O bond is 1.65 Å and that of an Se—OH bond is about 1.75 Å (Chomnilpan, Liminga, Sonneveld & Visser, 1981). The O—Se—O angles, 99–105°, are in the same range as those observed in other hydrogenseselenite and trihydrogen selenite compounds (Chomnilpan, Tellgren & Liminga, 1978). The geometry of the inorganic moiety, namely the presence of the two short Se—O bond distances, clearly implies that the diphenylguanidinium molecule is protonated.

Regarding the geometry of the *N,N'*-diphenylguanidinium cation ($dpgH^+$) it is pertinent to make a comparison with a similar compound, *N,N'*-diphenylguanidinium *m*-chlorobenzeneseleninate (Antolini *et al.*, 1991). Also relevant for discussion are the structures of *N*-adamant-1-yl-*N'*-(2-iodophenyl)guanidinium chloride (Weakley, Scherz & Keana, 1990), of the unprotonated molecules of *N,N'*-diphenylguanidine (dpg) (Zakharov, Andrianov & Struchkov, 1980) and of *N,N'*-bis(2-methylphenyl)guanidine (Brown & Gash, 1984).

The bond lengths C1—N1 [1.342 (4) Å] and C1—N3 [1.335 (4) Å] of the guanidinium group are close to the standard value of a delocalized C=N bond [1.339 (5) Å]
