**1,1,1,4,4,4-Hexamethoxy-1,4-disilabutane**

NORBERT W. MITZEL, JÜRGEN RIEDE AND HUBERT SCHMIDBAUR

Anorganisch-Chemisches Institut, Technische Universität München, Lichtenbergstrasse 4, D-85747 Garching, Germany. E-mail: n.w.mitzel@lrz.tu-muenchen.de

(Received 26 March 1997; accepted 17 April 1997)

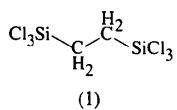

**Abstract**

Molecules of the title compound,  $C_2H_4Cl_6Si_2$ , have a crystallographic centre of inversion and adopt a *trans* conformation in the crystal. Important bond lengths

are C—C 1.536 (3), Si—C 1.8469 (15), and Si—Cl 2.0229 (6), 2.0225 (6) and 2.0283 (6) Å. The Cl atom *trans* to the C—C bond is tilted towards the C atom. There are no important intermolecular interactions.

### Comment

We have recently reported the gas-phase and solid-state structures of 1,4-disilabutane and 1,5-disilapentane (Mitzel, Smart, Blake, Robertson & Rankin, 1996) and the crystal structure of 1,4-dibromo-1,4-disilabutane (Mitzel, Riede & Schmidbaur, 1996). Simple carbosilane molecules and their halogen derivatives are currently being probed as single-source precursors for the epitaxic growth of  $\beta$ -SiC layers by chemical vapour deposition (Kunstmann *et al.*, 1995). 1,4-Disilabutane and 1,5-disilapentane and their  $\alpha,\omega$ -dibromo derivatives tend to eliminate ethene and propene, respectively, in the low-temperature regime of the deposition experiments with formation of Si layers, whereas in the high-temperature regime SiC is formed without loss of the carbon units. These observations led us to determine the molecular structures of these and related compounds in order to provide a structural basis for a discussion of the decomposition chemistry. An investigation of methyltrichlorosilane and 1,1,1,4,4,4-hexachloro-1,4-disilabutane, (1), as precursors has now been commenced and the molecular structures of these compounds are being determined in order to make a parallel comparison with the structure and decomposition chemistry of the corresponding carbosilanes and their bromo derivatives.

In the crystal, 1,1,1,4,4,4-hexachloro-1,4-disilabutane has a crystallographic centre of inversion (Fig. 1). 1,4-Dibromo-1,4-disilabutane (Mitzel, Riede & Schmidbaur, 1996), as well as other open-chain molecules with a symmetrical substitution pattern at the Si—C—C—Si unit that have been studied by crystallographic methods (Shibayeva, Atovmyan, Rozenberg & Stryukov, 1983; Tacke, Niedner, Frohnecke, Ernst & Sheldrick, 1980; Ovchinnikov, Shklover, Struchkov, Polyakov & Guselnikov, 1985), also have crystallographic inversion centres. Compound (1) also has almost perfect  $2/m$  symmetry, reflecting its ideal all-staggered conformation, which is not distorted by intermolecular forces in the crystal.

The C—C distance in (1) is very similar to those in the related compounds mentioned above, as is the Si—C distance. The C—C—Si angle also is equal to that in 1,4-dibromo-1,4-disilabutane [113.6 (4) $^\circ$ ] within the limits of error.

The  $\text{SiCl}_3$  group is tilted in a way that two C—Si—Cl angles are larger than the third [Cl2] by about

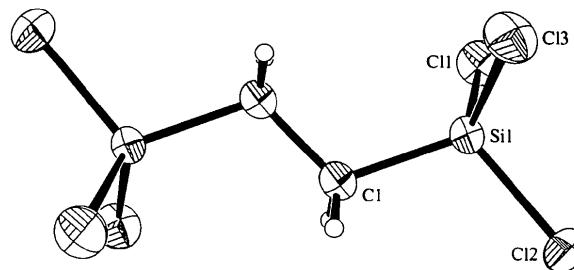

Fig. 1. A view of one molecule of (1) with the atom-numbering scheme. Displacement ellipsoids enclose 50% probability surfaces and H atoms are shown as spheres of arbitrary radii. The crystallographic centre of inversion is located in the middle of the C—C bond.

1.6 $^\circ$ . The two Cl atoms Cl1 and Cl3, which are bent away from the ethanediyl bridge, have slightly shorter Si—Cl distances (2.023 Å on average) than the Si—Cl2 distance [2.0283 (6) Å].

There are no important intermolecular interactions. The shortest such Cl···Cl non-bonded distances are 3.52 Å, which is about the sum of the van der Waals radii (3.62 Å; Emsley, 1991). The shortest intermolecular Si···Cl distance is 4.30 Å, indicating the absence of any Cl···Si donor–acceptor interaction comparable with the Si···Br interactions observed in 1,4-dibromo-1,4-disilabutane.

### Experimental

1,1,1,4,4,4-Hexachloro-1,4-disilabutane, (1), was prepared by a hydrosilylation reaction from vinyltrichlorosilane and trichlorosilane (Mitzel *et al.*, 1997). Crystals were grown by slowly cooling the melt to 290 K. For the X-ray diffraction experiment, one of these was transferred into a glass capillary and sealed under an atmosphere of dry argon at 223 K.

### Abstract

The structural features of some 1-aryl-1*H*,3*H*-thiazolo[3,4-*a*]benzimidazoles active against human immunodeficiency virus (HIV) are reported. The diffractometric analysis reveals that the title compounds, 1-(2,4-difluorophenyl)-1*H*,3*H*-thiazolo[3,4-*a*]benzimidazole,  $C_{15}H_{10}F_2N_2S$ , 1-(2,6-dichlorophenyl)-1*H*,3*H*-thiazolo[3,4-*a*]benzimidazole,  $C_{15}H_{10}Cl_2N_2S$ , and 1-(2-chloro-6-fluorophenyl)-1*H*,3*H*-thiazolo[3,4-*a*]benzimidazole,  $C_{15}H_{10}ClFN_2S$ , all adopt a butterfly-like conformation which appears to be particularly important for the inhibition of HIV-1 reverse transcriptase (RT), an enzyme which plays a key role in the viral life-cycle.

### Comment

In previous papers, we reported the synthesis and evaluation of anti-HIV activity of a series of 1*H*,3*H*-thiazolo[3,4-*a*]benzimidazole derivatives (Chimirri, Grasso, Monforte, Monforte & Zappalá, 1991; Monforte *et al.*, 1993; Bruno, Chimirri *et al.*, 1996; Chimirri *et al.*, 1996; Bruno, Monforte, Nicoló & Scopelliti, 1996). Some of the studied compounds exhibited significant activity (Chimirri *et al.*, 1991, 1996) and in particular the 1-(2,6-difluorophenyl)- derivative (TBZ) was found to be a highly potent non-nucleoside HIV-1 reverse transcriptase (RT) inhibitor (NNRTI) (Schultz *et al.*, 1992; Buckheit *et al.*, 1993; Bruno, Chimirri *et al.*, 1996). It was recently ascertained (Scafer *et al.*, 1993; Ding *et al.*, 1995) that some structural features, such as two systems arranged in a butterfly-like conformation and a hydrogen-bond acceptor in an appropriate position, are necessary for the inhibition of the RT enzyme. On this basis, it is very important to determine the geometry of thiazolobenzimidazole derivatives, a new class of anti-HIV agents, in order to clarify which molecular requirements are common to NNRTIs. As part of a broader structural and pharmacological study of these compounds, we report here the results of the X-ray
