Abstract

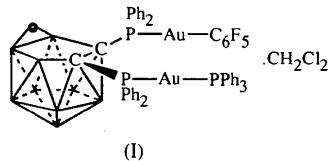

The title compound, $[\text{Au}_2(\text{C}_{26}\text{H}_{30}\text{B}_9\text{P}_2)(\text{C}_6\text{F}_5)(\text{C}_{18}\text{H}_{15}-\text{P})]\text{CH}_2\text{Cl}_2$, has a dinuclear structure with the diphenylphosphinocarbaborane moiety bridging the two Au atoms. There is a short intramolecular Au···Au contact of $2.9885 (8) \text{ \AA}$. The linear coordination at the Au^I atoms is highly distorted: P—Au—C 166.6 (2) and P—Au—P

164.69 (7)°. The open B₃C₂ face contains one bridging (B—H—B) H atom.

Comment

We are currently studying the coordination behaviour of the 7,8-bis(diphenylphosphino)-7,8-dicarba-*nido*-undecaborate anion (Crespo, Gimeno, Laguna & Jones, 1996). We have observed that the anionic diphosphine coordinates to gold(I) centres as a chelate, thus yielding three- and four-coordinated derivatives.

We report here the structure of the neutral title complex, (I), which crystallizes as a dichloromethane solvate. The 7,8-bis(diphenylphosphino)-7,8-dicarba-*nido*-undecaborate anion acts as a *P,P'*-bidentate bridging ligand, being bonded to two different Au—L groups. This represents the first example of a structure where the anionic diphosphine acts as a bridging ligand.

The molecule shows a distorted linear coordination at the Au^I atoms, with a P—Au—P angle of 164.69 (7)° and a P—Au—C angle of 166.6 (2)°, associated with a short Au···Au contact of 2.9885 (8) Å. This weak metal–metal interaction, termed ‘aurophilic attraction’, is interesting from a theoretical viewpoint, because the classical theory of chemical bonding does not provide a satisfactory explanation for it. Only when considered as a correlation effect, strengthened by relativistic effects, can this phenomenon be accounted for by theoretical studies (Kaltsoyannis, 1997; Pyykkö, 1997; Pyykkö, Runeberg & Mendizabal, 1997; Pyykkö & Mendizabal, 1997). These Au···Au contacts are comparable in strength to typical hydrogen bonds, associated with a bond energy of the order of 5–10 kcal mol^{−1} (Schmidbaur *et al.*, 1988; Narayanaswamy *et al.*, 1993). Furthermore, Hawthorne and co-workers (Harwell *et al.*, 1996) calculated, by a variable-temperature NMR investigation, that the energy barrier separating the gold–gold bonded state and the non-bonded state in a digold-*clos*-carborane derivative is 11±1 kcal mol^{−1}.

The Au1 atom is bonded to a P and a C atom (Fig. 1), with Au—P and Au—C bond distances of 2.300 (2) and 2.068 (8) Å, respectively; similar values were observed in related complexes such as [Au₂(dppm)(C₆F₅)₂] [dppm is bis(diphenylphosphino)methane] [Au—P = 2.288 (3) and 2.279 (3) Å, and Au—C = 2.063 (12) and 2.058 (12) Å; Jones & Thöne, 1992] or [Au(C₆F₅)₂(PPh₃)] [Au—P = 2.27 (1) Å and Au—C = 2.07 (2) Å; Baker *et al.*, 1972].

The Au2 atom is bonded to two P atoms, with Au—P bond distances of 2.326 (2) and 2.312 (2) Å; these values compare well with those found in

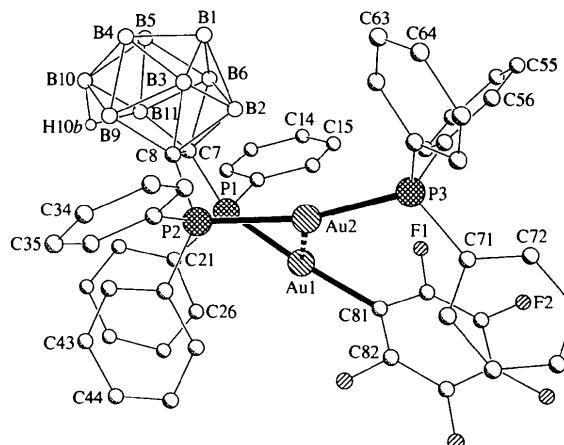

Fig. 1. The molecular structure of the title compound (solvent omitted). All H atoms, except the bridging open-face H atom, have been omitted.

other P—Au^I—P derivatives such as [Au(PPh₃)₂](BF₄)₂ [3.21 (3), 2.322 (3) Å; Wang, 1996] or [Au₂(dppm)₂](BF₄)₂ [2.311 (3) and 2.310 (3) Å; Porter *et al.*, 1989].

The Au—P(diphosphine) bond distances differ slightly; the bond *trans* to the PPh₃ group is longer, 2.326 (2) Å, probably as a consequence of the major *trans* influence of the PPh₃ moiety.

Phenyl and closed-faced carborane H atoms were geometrically set with a riding model, but the four open-face carborane H atoms were located in difference syntheses and refined using B—H distance restraints. The extra H atom, H10b, in the pentagonal B₃C₂ open face is strongly bonded to the central B atom [B10—H10b 1.00 (4) Å], but it can be considered as semibridging B11 [B11—H10b 1.50 (8) Å]. This distance is, however, longer than in other derivatives such as [AuCl₂{(PPh₂)₂C₂B₉H₁₀}][1.37 (7) Å; Jones, Villacampa *et al.*, 1997] or [Au{(PPh₂)₂C₂B₉H₁₀}]{(PPh₂)₂C₂B₁₀H₁₀}][1.35 Å; Crespo *et al.*, 1997]. As a consequence of the presence of heavy atoms, these values are imprecise, although we have observed a similar arrangement of H atoms in other complexes of the open-face carborane ligand (Crespo, Gimeno, Jones & Laguna, 1996). We have also determined the structure of the compound [C₂B₉H₁₀(SC₅H₄NH)₂](CF₃SO₃), where the H atoms were freely refined, clearly showing the bridging nature of this H atom [B—H distances 1.12 (3) and 1.39 (3) Å; Jones, Crespo *et al.*, 1997].

Experimental

To a solution of [Au{(PPh₂)₂C₂B₉H₁₀}](PPh₃) (Crespo, Gimeno, Laguna & Jones, 1996) (0.096 g, 0.1 mmol) in dichloromethane, [Au(C₆F₅)(C₄H₈S)] (0.0452 g, 0.1 mmol) was added. The solution was stirred for 1 h. Concentration of the solution to *ca* 5 ml and addition of *n*-hexane afforded a yellow solid (yield 65%). Analysis calculated for C₅₀H₄₅Au₂B₉F₅P₃: C 43.05, H 3.25%; found: C 43.4, H 3.7%;

Λ_M 5 Ω^{-1} $\text{cm}^2 \text{ mol}^{-1}$. NMR data: ^1H , $\delta = -2.0$ (*br*, 1H, BHB), 7.3–8 (*m*, 20H, Ph) p.p.m.; $^{31}\text{P}\{^1\text{H}\}$ (*ABX* system), $\delta_A = 40.1$, $\delta_B = 54.2$, $\delta_X = 50.3$ p.p.m., $J(AB) = 306$ Hz, $J(AX) = 56.2$ Hz, $J(BX) = 0$. ^{19}F , $\delta = -114.0$ (*m*, 2F, *o*-F), -158.2 [*t*, 1F, *p*-F, $J(\text{FF}) = 20.4$ Hz], -161.3 (*m*, 2F, *m*-F). Mass spectrum (LSIMS+): $m/z = 1326$ ($[M]^+$, 35%), 961 ($[M - \text{AuC}_6\text{F}_5]^+$, 40%), 459 ($[\text{AuPPPh}_3]^+$, 100%). Single crystals were obtained from an *n*-heptane–dichloromethane solution.

C21—P1—Au1	111.0 (2)	C8—P2—Au2	110.9 (2)

The significant residual electron density is in the heavy-atom region; the distance of the maximum peak, $2.570 \text{ e } \text{\AA}^{-3}$, to

the nearest atom (Au2) is 0.89 \AA . All non-H atoms were refined anisotropically. Most H atoms were refined using a riding model; those of the carbaborane open face were located in difference syntheses and refined with B—H distance restraints. A total of 82 restraints were applied, involving local phenyl and pentafluorophenyl ring symmetry (*FLAT/SAME* in *SHELXL93*; Sheldrick, 1993) in addition to the B—H restraints.

Data collection: *DIF4* (Stoe & Cie, 1988a). Cell refinement: *DIF4*. Data reduction: *REDU4* (Stoe & Cie, 1988b). Program(s) used to solve structure: *SHELXS86* (Sheldrick, 1990). Program(s) used to refine structure: *SHELXL93*. Molecular graphics: *XP* (Siemens, 1990b). Software used to prepare material for publication: *SHELXL93*.

We thank the Dirección General de Investigación Científica y Técnica (No. PB94-0079).

Supplementary data for this paper are available from the IUCr electronic archives (Reference: JZ1248). Services for accessing these data are described at the back of the journal. A displacement ellipsoid plot of the title compound has also been deposited.
