The space group $P \overline{1}$ was determined from non-systematic absences. Intensity data were corrected for Lorentz and polarization effects. The crystal structure was solved by direct methods using SHELXS86 (Sheldrick, 1985) and refined by full-matrix least-squares methods using SHELXL93 (Sheldrick, 1993) with anisotropic displacement parameters for all nonH atoms. All H atoms were located from difference Fourier maps and were refined isotropically in the final cycles. There were no significant features in the final difference Fourier map. Refinement of the H atoms led to $\mathrm{C}-\mathrm{H}$ distances in the range 0.88 (3)-1. 02 (2) $\AA . U$ values vary from 0.038 (6) to 0.078 (8) with a mean of $0.057(8) \AA^{2}$. All geometrical calculations were performed using GEOM. All computations were performed using IBM PCs.

Data collection: CAD-4 Software (Enraf-Nonius, 1989). Cell refinement: CAD-4 Software. Data reduction: Xtal3.2 (Hall et al., 1992). Program(s) used to solve structure: SHELXS86. Program(s) used to refine structure: SHELXL93. Molecular graphics: ORTEX (McArdle, 1995). Software used to prepare material for publication: SHELXL93.

The authors are grateful to Professor S. I. Cho, University of Seoul City, for data collection.

Supplementary data for this paper are available from the IUCr electronic archives (Reference: BK1362). Services for accessing these data are described at the back of the journal.

## Abstract

The title compound, $(4 S, 5 R)-3,4$-dimethyl-1-[(2R)-2( 1 -naphthyl)-2-phenylacetyl]-5-phenylimidazolidin-2one, $\mathrm{C}_{29} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{2}$, has two different aryl groups at the $\alpha$-carbon which confer a stereogenic character on the site. The geometry of the molecule is stabilized by an intramolecular hydrogen bond linking the acetamide and imidazolidine groups, which gives a planar character to the core.

## Comment

Acetamides have been reported as herbicides, especially those with an $\alpha$-chloro substituent (Couderchet et al., 1986). We have been studying the families of $\alpha$-aryland $\alpha, \alpha$-diarylacetamides and both have shown interesting growth-inhibitor properties against Avena sativa and Cyperus rotundus (Palacios et al., 1995). The diaryl family has a stereogenic center when the aryl groups are different. In order to synthesize enantiomerically pure $\alpha, \alpha$-(1-naphthyl)phenylacetamide, we have recently prepared the imidazolidin-2-one derivative (Lotz et al., 1994). The reaction described (see Experimental) provides two epimeric species, viz. ( $4 S, 5 R, 2^{\prime} S$ )-, (1), and (4S,5R, $2^{\prime} R$ )-3,4-dimethyl-1-[2'-(1-naphthyl)-2'-phenyl-
acetyl]-5-phenylimidazolidin-2-one, (2). We report here the crystal and molecular structure of (2).

(2)

Bond distances, angles and ring geometries are normal. The naphthyl group presents the usual 'hinge' deformation along the bond joining the fused phenyl rings, with an angle of $4.0(1)^{\circ}$ between normals. The imidazolidine ring displays a clear envelope character, with atoms $\mathrm{C} 3, \mathrm{C} 7, \mathrm{~N} 1$ and N 2 being coplanar [maximum deviation from planarity 0.018 (3) $\AA$ ] and C5 0.395 (3) $\AA$ out of the plane.

The central C atom (C5) is chiral. This allows speculation about the possible existence in this family of derivatives of different isomers with an eventual diversity in biological activity; however, to our knowledge, no work has yet been reported on this subject. Three fairly large groups are linked to the tetrahedral Cl atom and the torsion angles (Table 2) show how they are oriented relative to the bonds around Cl ; they give a minimum distance of 2.08 (4) $\AA$ between the $H$ atoms on C22 and C1.

The geometry of the 3,4-dimethyl-5-phenylimidazol-idin-2-one group does not differ significantly from that determined by Mulzer et al. (1995), except for the orientation of the phenyl group.

The geometry of the molecule is stabilized by an intramolecular hydrogen bond $[\mathrm{Cl}-\mathrm{H} 10.94$ (3), $\mathrm{H} 1 \cdots \mathrm{O} 2$ 2.25 (3) $\AA$ and $\mathrm{C} 1-\mathrm{H} 1 \cdots \mathrm{O} 2125(2)^{\circ}$; heavy dashed line in Fig. 1] which clamps any rotation around the acetamide $\mathrm{N} 1-\mathrm{C} 2$ bond, and favors coplanarity of the acetamide and imidazolidine groups. As a bonus, another short contact [O1 $\cdots \mathrm{H} 7 B 2.49$ (2) $\AA$; thin dashed line in Fig. 1] helps the process.

There is one weak intermolecular hydrogen-bond contact [C4—H4 $0.99(3), \mathrm{H} 4 \cdots \mathrm{Ol}^{\mathrm{i}} 2.52(4) \AA$ and $\mathrm{C} 4-\mathrm{H} 4 \cdots \mathrm{Ol}^{\mathrm{i}} 127(3)^{\circ}$; symmetry code: (i) $x-1, y$, $z$ ], which links molecules by translation along the crystallographic $a$ axis. The large naphthalene groups are in two orientations, parallel to the crystallographic $a$ axis [roughly $(013)$ and $(01 \overline{3})$ ], in an arrangement which suggests that the accommodation of these large planar groups dominates the packing process.

The absolute configuration of (2) was determined from the known absolute structure of the precursor, and the result is in accordance with the most probable conformation derived from calculations performed with the program AM1 (Dewar et al., 1985). Determination of the chirality from the X-ray data was not possible.

Fig. I. The molecular diagram of (2) showing the numbering of atoms. as well as a schematic representation of intramolecular contacts. Displacement ellipsoids are drawn at the $50 \%$ probability level.

## Experimental

To distilled liquid ammonia ( 150 ml , previously dried under nitrogen with sodium metal) under nitrogen was added lithium metal ( 1 mmol ) and the mixture allowed to react for 1 h until the amide was formed. Then the precursor $(4 S, 5 R)$-3,4-di-methyl-5-phenyl-1-( $2^{\prime}$-phenylacetyl)imidazolidin-2-one was added. The system was allowed to react under irradiation ( $h \nu_{\text {max }}=350 \mathrm{~nm}$ ). After 2 h , the reaction was quenched by adding ammonium nitrate in excess and the ammonia was allowed to evaporate. The residue was dissolved in water. the solution extracted with dichloromethane and the solvent removed under reduced pressure. Finally, the residue was separated by chromatographic methods to yield (1) (m.p. 428 K . yield: $33.6 \%$, crystallized from hexane); ${ }^{1} \mathrm{H}$ NMR $\left(200 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 0.79(d, 3 \mathrm{H}, J=8 \mathrm{~Hz}), 2.77(s, 3 \mathrm{H}), 3.91$ $(d q, 1 \mathrm{H}), 5.3(s, 3 \mathrm{H}), 5.39(d, 1 \mathrm{H}, J=8 \mathrm{~Hz}), 6.9-8.2(m, 17 \mathrm{H})$; ${ }^{13} \mathrm{C}$ NMR ( $50 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): 14.9, 28.2, 51.6, 53.6. 59.7. $123.9,124.9,125.5,125.9,126.3,127.0,127.5,127.8,128.1$, $128.2,128.6,129.7,131.8,134.0,134.8,136.1,138.4,155.3$. 171.3; MS ( $m / e$ ) (relative intensity): 434 ( $40.5, M^{+}$), 308 (2.3), 244 (62.8), 217 (55.8), 215 (100), 202 (19.6), 189 (13.6), 58 (11.4); analysis calculated for $\mathrm{C}_{29} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{2}: \mathrm{C} 80.18, \mathrm{H} 5.99, \mathrm{~N}$ $6.45 \%$; found: C 80.94, H 6.09 , N $6.50 \%$; and (2) (solid, m.p. $459-460 \mathrm{~K}$, yield: $20 \%$, crystallized from ethyl acetate); ${ }^{1} \mathrm{H}$ NMR ( $200 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 0.78(d, 3 \mathrm{H}, J=7.5 \mathrm{~Hz}), 2.82(s$, $3 \mathrm{H}), 3.92(d q, 1 \mathrm{H}), 5.29(s, 3 \mathrm{H}), 5.38(d, 1 \mathrm{H}, J=10 \mathrm{~Hz}), 7.0-$ $8.19(m, 17 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $50 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): 14.9, 28.2, 51.3, $53.6,59.7,123.4,125.2,125.4,126.4,126.9,127.2,127.3$, $127.6,128.0,128.2,128.4,128.7,129.8,131.9,133.8,135.7$. 136.1, 137.8, 155.3, 171.2; MS ( $m / e$ ) (relative intensity): 434 (41.0, $\left.M^{+}\right), 244$ (62.7), 217 (55.4). 215 (100). 202 (19.3). 189 (13.3), 58 (9.6); analysis calculated for $\mathrm{C}_{29} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{2}$ : C

The data set was collected with Mo $K_{\alpha}$ radiation up to $50^{\circ}$ in $2 \theta$. The structure was solved by direct methods and completed through successive cycles of $\Delta F$ synthesis, where all the H atoms in the structure were finally found. The resulting model was refined on $F^{2}$ using the whole data set, with anisotropic displacement factors for non- H atoms and an isotropic model for H atoms. The final $\Delta F$ synthesis proved remarkably featureless.

## Abstract

The crystal of the title compound, $\mathrm{C}_{13} \mathrm{H}_{22} \mathrm{O}_{2} \mathrm{~S}$, has two independent molecules in the asymmetric unit. The molecular dimensions are normal. Molecules are linked into chains along the $b$ direction by $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, with $\mathrm{O} \cdots \mathrm{O}$ distances of $2.655(5)$ and 2.693 (5) A.
