## Abstract

(4-Methoxyphenyl)diphenylmethanol $\left(\mathrm{C}_{20} \mathrm{H}_{18} \mathrm{O}_{2}\right)$ crystallizes with two independent molecules; the molecules are linked by $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds into centrosymmetric tetramers in which two molecules form a cyclic $R_{2}^{2}(16)$ motif from which the other two are pendant, giving a $D_{3}^{3}(11)\left[R_{2}^{2}(16)\right]$ pattern. In tris(2-methoxyphenyl)methanol $\left(\mathrm{C}_{22} \mathrm{H}_{22} \mathrm{O}_{4}\right)$ the hydroxy H atoms are disordered over two sites; whichever site is occupied, an intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bond is formed with a methoxy O atom.

## Comment

Triphenylmethanol, $\mathrm{Ph}_{3} \mathrm{COH}$, crystallizes as almost perfectly tetrahedral tetramers (Ferguson et al., 1992), in which the four hydroxy-H atoms are mobile over 12 sites along the six $\mathrm{O} \cdots \mathrm{O}$ edges of the tetrahedron (Aliev et al., 1998). By contrast, tris(4-methoxyphenyl)methanol [ $\left.\left(4-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right)_{3} \mathrm{COH}\right]$ forms an open dimer in which only one of the two independent hydroxy groups is involved in hydrogen bonding (Ferguson et al., 1996). In view of the major differences in supramolecular aggregation between $\mathrm{Ph}_{3} \mathrm{COH}$ and (4$\left.\mathrm{MeOC}_{6} \mathrm{H}_{4}\right)_{3} \mathrm{COH}$, we have now investigated the structures of (I) (4-methoxyphenyl)diphenylmethanol [(4$\left.\left.\mathrm{MeOC}_{6} \mathrm{H}_{4}\right) \mathrm{Ph}_{2} \mathrm{COH}\right]$ and (II) tris(2-methoxyphenyl)methanol [(2-MeOC $\left.\left.{ }_{6} \mathrm{H}_{4}\right)_{3} \mathrm{COH}\right]$.

Compound (I) crystallizes in space group $P \overline{1}$, with $Z^{\prime}=2$ (Wilson, 1993; Brock \& Dunitz, 1994). The hydrogen-bonding characteristics of the two independent molecules (Fig. 1) are quite different. Pairs of molecules of type $A$ (containing Ol) form cyclic centrosymmetric dimers characterized by an $R_{2}^{2}(16)$ motif (Bernstein et al., 1995); in these dimers the hydroxy-O atom Ol at $(x, y, z)$ acts as donor to the methoxy-O atom O14 at ( $1-x, 1-y, 1-z$ ). This association results in a 3.481 (2) A plane-to-plane separation of the C111-C116 aromatic rings at $(x, y, z)$ and $(1-x, 1-y, 1-z)$. Molecules of type $B$ (containing O 2 ) are attached to this dimer by means of $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds involving the hydroxy groups only (Fig. 1, Table 2); the overall supramolecular aggregate is thus a centrosymmetric tetramer. The first-level graph set for this tetramer is thus $N_{1}=D R_{2}^{2}(16)$; the combination of the two types of hydrogen bond (Table 2) described by $N_{1}$ provides a
finite pattern of type $D_{3}^{3}(11)$, so giving $D_{3}^{3}(11)\left[R_{2}^{2}(16)\right]$ as the overall pattern descriptor (Bernstein et al., 1995). The $D[R]$ pattern has been noted (Bernstein et al., 1995) as very common in centrosymmetric structures having $Z^{\prime}>1$. This pattern is absent in $\left(4-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right)_{3} \mathrm{COH}$, where $Z^{\prime}=2$ in the non-centrosymmetric space group $P 2_{1}$ (Ferguson et al., 1996).

The supramolecular aggregation in (I) is thus wholly different from the patterns observed in $\mathrm{Ph}_{3} \mathrm{COH}$ (Ferguson et al., 1992) and $\mathrm{Ph}_{3} \mathrm{CCH}_{2} \mathrm{OH}$ (Ferguson et al., 1994), where the tetramers are respectively tetrahedral and almost square planar. Moreover, it differs significantly from the patterns found in compounds analogous to (I), having a single hydrogen-bond acceptor function in one of the substituents only. Thus in diphenyl(4-pyridyl)methanol $\left[\left(\mathrm{NC}_{5} \mathrm{H}_{4}\right) \mathrm{Ph}_{2} \mathrm{COH}\right.$; Glidewell \& Ferguson, 1994] and 3-(hydroxydiphenylmethyl)-3H-azepine $\left[\left(\mathrm{NC}_{6} \mathrm{H}_{6}\right) \mathrm{Ph}_{2} \mathrm{COH}\right.$; Lindner \& von Gross, 1973], the molecules are linked by $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds into continuous chains: a $C(7)$ chain generated by translation and a $C(6)$ chain generated by the action of a 2 , axis, respectively. In 4,4-dimethyl-5-(hydroxydiphenyl-methyl)-4,5-dihydroisoxazole [ $\left(\mathrm{C}_{5} \mathrm{H}_{8} \mathrm{NO}\right) \mathrm{Ph}_{2} \mathrm{COH}$ ] the molecules are linked by $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds into $R_{2}^{2}(12)$ dimers (Armesto et al., 1990); although these dimers bear some resemblance to the dimeric unit in (I) formed from type $A$ molecules only, they do not have

Fig. 1. A view of the centrosymmetric tetrameric aggregate in compound (I), showing the atom-labelling scheme. Displacement ellipsoids are drawn at the $30 \%$ probability level. Atoms $\mathrm{Ol}^{\prime}, \mathrm{Cl}^{\prime}$ etc., are at equivalent position ( $1-x, 1-y, 1-z$ ). For clarity, the only H atoms shown are those involved in the hydrogen bonding.
pendant components comparable to the type $B$ molecules in (I).

As well as having different hydrogen-bonding properties, the two independent molecules in (I) also have significantly different conformations (Table 1): in molecule $A$ the conformation of the triarylmethyl fragment, ignoring the hydroxy and methoxyl groups, is not far from $C_{3}$ symmetry, whereas in molecule $B$ the corresponding $\mathrm{O}-\mathrm{C}-\mathrm{C}-\mathrm{C}$ torsion angles for the three rings are very different. In addition, the $\mathrm{C}-\mathrm{O}-\mathrm{C}-\mathrm{C}$ torsion angles indicate near coplanarity of the exocyclic group with its aryl ring only in molecule $B$.

Compound (II) exhibits no intermolecular hydrogen bonding; instead, the hydroxy-H atom, which is essentially equally disordered over two sites (Fig. 2), engages in intramolecular hydrogen bonding, forming puckered $S(6)$ rings with two of the three methoxyl groups. In this respect the hydrogen-bonding pattern is reminiscent of that in (2-pyridyl)diphenylmethanol, where an $S(5)$ ring is formed (Ferguson et al., 1995).

Fig. 2. The asymmetric unit in compound (II), showing the atomlabelling scheme. Displacement ellipsoids are drawn at the $30 \%$ probability level.

The geometries of the $\mathrm{CH}_{3}-\mathrm{O}-\mathrm{C}-\mathrm{C}$ fragments in the two independent molecules of (I) (Table 1) and in (II) (Table 3) exhibit the same patterns as found both in (4-MeOC $\left.\mathrm{H}_{4}\right)_{3} \mathrm{COH}$ and in anisole (Seip \& Seip, 1973): the exocyclic $\mathrm{C}-\mathrm{O}-\mathrm{C}$ angles are significantly larger than tetrahedral, while the $\mathrm{O}-\mathrm{C}-\mathrm{C}$ angles, respectively cisoid and transoid to the methoxy substituent, lie in the ranges $121.9(2)-124.9(2)^{\circ}$ and $115.7(2)-$ $117.2(1)^{\circ}$, consistent with previous observations. The bond distances are all typical of their types (Allen et al., 1987).

## Experimental

Compound (I) was prepared by hydrolysis of chloro-(4-methoxyphenyl) diphenylmethane with dilute aqueous sodium carbonate; the crude product was an oil. which was repeatedly crystallized from light petroleum. Analysis: found C 82.7, H $6.2 \%$; $\mathrm{C}_{20} \mathrm{H}_{18} \mathrm{O}_{2}$ requires C 82.7 , $\mathrm{H} 6.3 \%$. Compound (II) was prepared by reaction of 2-methoxyphenylmagnesium bromide with diethyl carbonate. followed by acid work-up and recrystallization, firstly from acetone/dichloromethane and secondly from methanol (m.p. 454 K . literature value 454 K : Morton \& Brachman, 1954). Analysis: found $\mathrm{C} 75.2, \mathrm{H} 6.2 \% ; \mathrm{C}_{22} \mathrm{H}_{22} \mathrm{O}_{4}$ requires $\mathrm{C} 75.4, \mathrm{H} 6.3 \%$. For both compounds, crystals suitable for single-crystal X-ray diffraction were selected directly from the analytical samples.

Compound (I) crystallized in the triclinic system; space group $P \overline{1}$ was assumed and confirmed by the analysis. Compound (II) crystallized in the monoclinic system; space groups $C c$ or $C 2 / c$ were indicated by the systematic absences. Both were investigated and $C c$ shown to be correct. Although a complete set of Friedel pair reflections was collected to $\theta=25.2^{\circ}$, the small anomalous scattering of C and O did not allow us to determine the direction of the polar axis in this case. Difference maps at an intermediate stage showed that the hydroxy-H atom of (II) was disordered over two adjacent sites. Refining these H -atom occupancies resulted in values of 0.56 (3) and 0.44 (3). For both compounds, H atoms were treated as riding atoms ( $\mathrm{C}-\mathrm{H} 0.93$ and $0.96, \mathrm{O}-\mathrm{H} 0.82 \AA$ ).

For both compounds, data collection: CAD-4-PC Software (Enraf-Nonius, 1992); cell refinement: SET4 and CELDIM in CAD-4-PC; data reduction: DATRD2 in NRCVAX96 (Gabe et al., 1989); program(s) used to solve structures: SHELXS 97 (Sheldrick, 1997b); program(s) used to refine structures: NRCVAX96 and SHELXL97 (Sheldrick, 1997a); molecular graphics: NRCVAX96, ORTEPII (Johnson, 1976) and PLATON (Spek, 1998); software used to prepare material for publication: NRCVAX96, SHELXL97 and PREP8 (Ferguson, 1998).

We thank Peter Jaspers-Fayer of the University of Guelph Computing Centre Services Division for his invaluable assistance in installing the LINUX operating system and associated graphics routines on the Dell Inspiron 3200266 MHz Pentium-II laptop computer used for all the calculations in the analysis of compound (II).

#### Abstract

The title compounds, 2,4-dibromo-6-chloroaniline, $\mathrm{C}_{6} \mathrm{H}_{4}$ $\mathrm{Br}_{2} \mathrm{ClN}$, (1), N -acetyl-4-bromo-2,6-dichloroaniline (alternative name: $4^{\prime}$-bromo- $2^{\prime}, 6^{\prime}$-dichloroacetanilide), $\mathrm{C}_{8} \mathrm{H}_{6}-$ $\mathrm{BrCl}_{2} \mathrm{NO}$, (2), and $N$-formyl-4-bromo-2,6-difluoroaniline [alternative name: $N$-(4-bromo-2,6-difluorophenyl)formamide], $\mathrm{C}_{7} \mathrm{H}_{4} \mathrm{BrF}_{2} \mathrm{NO}$, (3), all have at least one short cell axis (in the range $4.2-4.7 \AA$ ) and contain molecules which are linked to form infinite chains along the short-axis directions via $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ or $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds. Compound (1) has halogen disorder at the 2 and 6 positions.

## Comment

The aniline derivatives (1) and (2) arose as minor byproducts in a synthetic scheme; compound (3) was synthesized by an unequivocal route. The X-ray analyses were undertaken to establish their structures and to provide details of their conformation and hydrogen bonding. Molecule (1) is isomorphous with 2,4,6-tribromoaniline (Christensen \& Stromme, 1969). Molecule (2) is isostructural with $N$-acetyl-2,4,6-trichloroaniline, (4) (Nyburg et al., 1987).

(1)

(2)

(3)

Views of the three molecules are presented in Fig. 1. In (1), the sizes of the electron-density maxima at the ortho sites were consistent with an unequal disorder of Br and Cl atoms; refinement showed that the ratio was 0.639 (4)/0.361 (4). This disorder effectively precludes any meaningful discussion of ring dimensions. Compounds (2) and (3) show the typical variation in benzene ring internal angles found in polyatomic substituted benzene rings, with the rings showing 2 mm symmetry about the $\mathrm{Cl} \cdots \mathrm{C} 4$ axis at a $3 \sigma$ significance level (Domenicano, 1992); the mean internal angles at the ortho and para sites exceed $120^{\circ}$, while those at the 1 and meta positions are smaller (Table 1).

The amount by which the group at Cl is rotated out of the aromatic ring plane in each molecule is of interest. For (1), difference maps showed that the H atoms of the $\mathrm{NH}_{2}$ group lay approximately in the aromatic ring plane. For (2), the plane of the $N$-acetyl group is rotated $60.97(14)^{\circ}$ from coplanarity with the aromatic ring; for (3), the corresponding value for the rotation of the $N$-formyl group is 57.3 (3) ${ }^{\circ}$. Details of the relevant torsion angles in (2) and (3), along with those of (4) for comparison, are given in Table 2. All three compounds adopt a conformation by which the carbonyl group is cis to the exocyclic $\mathrm{C}-\mathrm{N}$ bond.
