#### Abstract

The structure determination of the title compound, $\mathrm{C}_{13} \mathrm{H}_{11} \mathrm{NO}_{2}$, establishes the tautomeric keto form of the salicylaldimine. The asymmetric unit consists of two crystallographically independent molecules which are essentially planar and are approximately orthogonal to each other. Strong intramolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ interactions influence the conformation of the molecules and the crystal packing. Intermolecular hydrogen bonds link the molecules in infinite chains.

## Comment

Salicylaldimines have been used extensively as ligands in coordination chemistry because of their diverse chelating ability (Long, 1995; Garnovski et al., 1993). The intramolecular hydrogen bond between O and N atoms in these systems plays a vital role in the formation of Schiff base compounds in the solid state by proton transfer from the hydroxyl-O atom to the imine-N atom (Hadjoudis et al., 1987; Elerman et al., 1997). The charge transfer through overlapping intermolecular $\pi$ orbitals, with the associated change in the $\pi$-electron configuration in these compounds, also provides a basis for the development of molecular switches (Xu et al., 1994). This X-ray crystallographic study was undertaken in order to establish the solid-state molecular structure of (I) and to build up a hierarchy for N -substituted salicylaldimines.

A structure with this salicylaldimine in enol form was reported by Elerman et al. (1995), based on poor quality data ( $18 \%$ intensity decay and affected by disorder). In the present crystals, the salicylaldimine takes the tautomeric keto form. The asymmetric unit of the title compound, (I), consists of two crystallographically independent, but nearly identical, molecules ( $A$ and $B$ ) which are approximately orthogonal to each other; the dihedral angle between the essentially planar molecules $A$ (r.m.s. deviation $0.117 \AA$ ) and $B$ (r.m.s. deviation $0.120 \AA$ ) is $84.55(3)^{\circ}$. The torsion angles $\mathrm{C} 6-\mathrm{N} 1-\mathrm{C} 7-\mathrm{C} 8179.4$ (1) and $\mathrm{C} 19-\mathrm{N} 2-\mathrm{C} 20-\mathrm{C} 21$ $179.9(1)^{\circ}$ also illustrate that the molecules are almost planar. The $\mathrm{C}-\mathrm{O}($ hydroxyl $)$ [ 1.348 (2) and 1.354 (2) $\AA$ in $A$ and $B$, respectively] and $\mathrm{N}-\mathrm{C}$ (phenyl) [1.412 (2) and 1.412 (2) $\AA$ in $A$ and $B$, respectively] bond lengths are consistent with typical values in related compounds (Elerman et al., 1995; Elmali \& Elerman, 1997). The imine- N atoms ( N 1 and N 2 ) are $s p^{2}$ hybridized with bond angles summing to $360.0^{\circ}$. Each displays trigonal planar bonding geometry and the coplanarity of the resulting pseudo-rings ( $\mathrm{N} 1, \mathrm{C} 7, \mathrm{C} 8, \mathrm{C} 13, \mathrm{O} 2, \mathrm{H} 1 \mathrm{~N}$ in $A$ and $\mathrm{N} 2, \mathrm{C} 20, \mathrm{C} 21, \mathrm{C} 26, \mathrm{O} 4, \mathrm{H} 2 \mathrm{~N}$ in $B$ ) strongly suggests a resonance interaction in the pseudo-rings. This is reflected in the deviations of the C7-C8 [1.416(2)], C20-C21 [1.410 (2)], C13-O2 [1.294 (2)] and C26O 4 [1.297 (2) $\AA$ ] bond lengths from standard $\mathrm{C}=\mathrm{C}$ and $\mathrm{C}=\mathrm{O}$ distances. A similar observation has been reported for 1-[N-(4-methyl-2-pyridyl)aminomethylene]-2(1H)-naphthalenone (Elerman et al., 1998).

enol form

keto form
(I)

Strong intra- and intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ interactions influence the conformations of molecules $A$ and $B$, and the crystal packing. The atoms H1N and H2N were located from a difference Fourier map at the end of the refinement process as small positive electron densities. In molecule $A$, the $\mathrm{N} 1-\mathrm{H} 1 \mathrm{~N}$ and $\mathrm{H} 1 \mathrm{~N} \cdots \mathrm{O} 2$ distances are 0.851 and $1.852 \AA$, respectively, while the corresponding values in $B$ for $\mathrm{N} 2-\mathrm{H} 2 \mathrm{~N}$ and $\mathrm{H} 2 \mathrm{~N} \cdots \mathrm{O} 4$ are 0.867 and $1.850 \AA$, respectively. The planarity of the molecules in (I) makes it possible for the proton to transfer through the hydrogen bond with a small energy requirement (Bregman et al., 1964). Unlike the observations of Elerman et al. (1995) for the enol form of (I), $N$-(2-hydroxyphenyl)salicylaldimine, the present structure analysis does not show any disorder of the molecule or intramolecular $\mathrm{O} \cdots \mathrm{O}$ hydrogen bonding. The crystal packing is stabi-
lized by intra- and intermolecular hydrogen bonds via oxo- and hydroxyl-O atoms. The molecules are linked by $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds into infinite chains with the sequence $A \cdots B \cdots A \cdots B$

## Experimental

$N$ - $p$-acetophenylsalicylaldimine (SACPNH) was prepared by condensation of equimolar quantities of salicylaldehyde and 4 -aminoacetophenone in refluxing ethanol. Compound (I) was
obtained from the reaction of 2-aminophenol $(0.002 \mathrm{~mol}$, 0.22 g ) with a solution of SACPNH ( $0.002 \mathrm{~mol}, 0.48 \mathrm{~g}$ ) in 40 ml of ethanol. The orange-red precipitate was separated and recrystallized in methylene chloride- $n$-hexane solution.

Symmetry codes: (i) $1-x,-y, 2-z:$ (ii) $2-x,-y, 2-z$.
The structure was solved by direct methods and refined by full-matrix anisotropic least squares without any constraint. H atoms were located from the difference Fourier maps; their positions were then idealized and treated as riding, and their isotropic displacement parameters were refined.

#### Abstract

A single-crystal X-ray diffraction study of the title compound ( $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{2}$ ) confirms the chair conformation of the piperazine ring, with the methyl and phenyl groups in

 axial orientations.
## Comment

The major highlight of this investigation is the presence of an alternate chair conformation of the piperazine ring of the title compound, (I), in which the phenyl and the methyl groups assume axial orientations. The nor-

(I)
mal chair conformation with equatorial substituents is not preferred due to the steric interaction between the $N$-formyl and phenyl groups. The C5-C6 and C3C2 bond distances, 1.519 (3) and 1.537 (3) $\AA$, respectively, are in the range $1.515-1.535 \AA$ reported for other piperazine derivatives (Sekido et al., 1985; Okamato et al., 1979, 1982; Sakurai et al., 1977; Davis \& Hassel, 1963). The bond angles around the Csp ${ }^{3}$ atoms in the piperazine ring [109.0(2)-111.3(2) ${ }^{\circ}$ ] indicate only slight distortion from the tetrahedral arrangement of groups around these atoms. The bond angles around N1 and N4 [116.6(2)-122.2 (2) ${ }^{\circ}$ ] suggest $s p^{2}$ character for these atoms, as in the case of similar piperazine derivatives (Sekido et al., 1985; Okamato et al., 1979; Sakurai et al., 1977). The N1 and N4 atoms are at a dis-
tance of 0.554 (2) and -0.594 (2) $\AA$, respectively, from the C2--C3-C5-C6 plane, indicating a chair conformation in which the two N atoms are unsymmetrically disposed. The axial orientations of the methyl and the two phenyl groups are evident from the torsion angles, N4-C5-C6-C9 76.9(2), N1-C2-C3-C16 $-78.0(2)$ and $\mathrm{N} 4-\mathrm{C} 3-\mathrm{C} 2-\mathrm{C} 10-78.2(2)^{\circ}$.

Fig. I. ZORTEP (Zsolnai, 1997) plot of (I) showing $30 \%$ probability displacement ellipsoids. The H atoms are omitted for clarity.

## Experimental

The title compound was obtained by the formylation of $t$-5-methyl- $r$ - $2, t$ - 3 -diphenylpiperazine by a mixture of acetic anhydride and $85 \%$ formic acid using benzene as solvent. The crude product isolated from the benzene layer was recrystallized using ethanol.
