#### Abstract

The oxpn ligand [oxpn $=N, N^{\prime}$-bis(3-aminopropyl)oxamide] in the title compound, $\mu$-[ $N, N^{\prime}$-bis(3-aminopropyl)oxamidato( $2-)]-N, N^{\prime}, O^{\prime}: N^{\prime \prime}, N^{\prime \prime}, O$-bis[(imidazole$N^{3}$ ) (nitrato- $O$ ) copper (II) ], $\left[\mathrm{Cu}_{2}\left(\mathrm{C}_{8} \mathrm{H}_{16} \mathrm{~N}_{4} \mathrm{O}_{2}\right)\left(\mathrm{NO}_{3}\right)_{2}-\right.$ $\left.\left(\mathrm{C}_{3} \mathrm{H}_{4} \mathrm{~N}_{2}\right)_{2}\right]$, is bis-tridentate in a trans conformation, bridging two $\mathrm{Cu}^{\mathrm{II}}$ ions to form a centrosymmetric binuclear molecule. The symmetry-equivalent central $\mathrm{Cu}^{\mathrm{II}}$ ions are located in a distorted square-based pyramid, with an O atom from the nitrate ion bonded at the axial site, and a $\mathrm{Cu} \cdots \mathrm{Cu}$ distance of 5.242 (2) $\AA$.

## Comment

As extending bridging ligands transmitting a strong magnetic exchange interaction, oxamidates have played a key role in the design of polymetallic systems (Ojima \& Nonoyama, 1988). One of the most important factors for the versatility of the ligands is their easy cistrans conformational change to afford symmetric or asymmetric oxamidato bridges. We report here the
crystal structure of a binuclear copper(II) complex with a bridging $N, N^{\prime}$-bis(3-aminopropyl)oxamide (oxpn) ligand in the trans conformation, (I).

(I)

The structure of this complex consists of centrosymmetric binuclear molecules, with oxpn acting as a bistridentate ligand, in which the $\mathrm{Cu}^{1 \mathrm{I}}$ ions are bridged by a trans-oxamidato group with an inversion centre in the middle of the $\mathrm{Cl}-\mathrm{Cl}^{\mathrm{i}}$ bond [symmetry code: (i) $2-x, 1-y, 1-z]$ (Fig. 1). The $\mathrm{Cu}^{11}$ ion is in a distorted square-pyramidal geometry, with three atoms from the oxpn ligand ( $\mathrm{N} 1, \mathrm{~N} 2$ and O 1 ) and one N atom (N3) from the imidazole in the basal plane, while the axial coordination site is occupied by a nitrate O atom (O2). The four atoms of the coordination plane are almost coplanar, with deviations from the least-squares plane of less than $0.055 \AA$. The $\mathrm{Cu}^{\text {II }}$ ion deviates by $0.043 \AA$ towards the O atom belonging to the semicoordinated nitrate anion $[\mathrm{Cu}-\mathrm{O} 2.673$ (2) A$]$.

Fig. 1. The molecular structure of (I), showing $50 \%$ probability displacement ellipsoids. H atoms have been omitted for clarity.

The bond distances for $\mathrm{Cu}-\mathrm{N} 1, \mathrm{Cu}-\mathrm{N} 2$ and $\mathrm{Cu}-$ N3 [1.967 (2), 2.003 (2) and 1.982 (2) Å, respectively] are close to those observed in parent oxamidato-bridged copper(II) complexes (Chen, Tang \& Yu, 1994; Sanz et al., 1996). The significant shortening of the Cu Nl bond distance is in agreement with the stronger basicity of the deprotonated amide N atom (Chen, Tang
\& Yu, 1994; Chen, Fu, Yu \& Tang, 1994). The bistridentate character of the ligand produces one five- and one six-membered chelate ring on each Cu atom, the angle subtended at the metal atom by the latter being larger $\left[95.10(8)^{\circ}\right.$ for $\mathrm{N} 1-\mathrm{Cu}-\mathrm{N} 2$ ] than that of the former [83.57 (8) ${ }^{\circ}$ for $\left.\mathrm{Ol}-\mathrm{Cu}-\mathrm{N} 1\right]$. The three atoms around N1 lie in a plane, with bond angles of 112.7 (2), 129.4 (2) and $117.6(2)^{\circ}$ for $\mathrm{Cu}-\mathrm{N} 1-\mathrm{C} 1, \mathrm{Cu}-\mathrm{N} 1-$ C 2 and $\mathrm{C} 1-\mathrm{N} 1-\mathrm{C} 2$, respectively. This fact, together with the values of the bond lengths involved and the planarity of the $N$-oxamidato ligand, reveals that N 1 and its symmetry-related $\mathrm{N1}^{\mathrm{i}}$ atom are $s p^{2}$-hybridized and that the $\pi$-carbonyl electrons are delocalized to form a conjugated system. The length of $\mathrm{C} 1-\mathrm{Cl}^{\mathrm{i}}[1.504$ (4) $\AA$ ] is very close to that observed in other oxamidato-bridged copper(II) complexes (Chen, Tang \& Yu, 1994; Chen et al., 1996).

The nitrate group is planar, as expected. The imidazole ring shows no significant deviation from planarity, with the largest deviation being $0.0025 \AA$. The $\mathrm{Cu} \cdot \cdot \mathrm{Cu}$ separation through the oxpn bridge is 5.242 (2) $\AA$. The binuclear molecules are connected by hydrogen bonds involving the imidazole $\mathrm{N} 4-\mathrm{H} 9$ group and the $\mathrm{O} 4^{\text {ii }}$ atom [symmetry code: (ii) $1-x, 1-y, 1-z$ ], with an $\mathrm{N} \cdots \mathrm{O}$ distance of 2.876 (3) $\AA$.

## Experimental

The $\mathrm{H}_{2} \mathrm{Oxpn}$ ligand and its mononuclear copper compound, $\mathrm{Cu}(\text { oxpn })_{2} \cdot \mathrm{H}_{2} \mathrm{O}$, were obtained according to the literature method of Ojima \& Yamada (1968). The binuclear complex was prepared by adding an aqueous solution of copper nitrate ( $1 \mathrm{mmol}, 5 \mathrm{ml}$ ) to a heated aqueous solution of $\mathrm{Cu}(\mathrm{oxpn})_{2} \cdot \mathrm{H}_{2} \mathrm{O}(1 \mathrm{mmol}, 50 \mathrm{ml})$ with stirring. An aqueous solution of imidazole ( $2 \mathrm{mmol}, 10 \mathrm{ml}$ ) was then added to the resulting blue solution. After standing at room temperature for several days, well formed green crystals of (I) were obtained by slow evaporation.

#### Abstract

The title compound, $\left[\mathrm{SnCl}_{2}\left(\mathrm{C}_{4} \mathrm{H}_{9}\right)_{2}\left(\mathrm{C}_{10} \mathrm{H}_{8} \mathrm{~N}_{2}\right)\right]$, is the product of the reaction of $2,2^{\prime}$-bipyridyl with dibutyltin dichloride. The $\mathrm{Sn}^{\text {IV }}$ centre is octahedrally coordinated by a bidentate $2,2^{\prime}$-bipyridyl ligand, two cis chlorides and two trans butyl groups. The extensively delocalized bipyridyl group is not absolutely planar, with the pyridyl rings twisted by $7.5(3)^{\circ}$.

## Comment

The title compound is a six-coordinated organotin complex of the type $R_{2} \operatorname{Sn} X_{2} L_{2}$, where $R$ is an alkyl or aryl group, $X$ is a halogen and $L_{2}$ is a bidentate nitrogen-donor ligand. The importance of this compound comes from its reported antitumour activity (Crowe et al., 1984), which is probably due to the rather long $\mathrm{Sn}-\mathrm{N}$ bond lengths. The structural investigation of the present compound, (I), is part of an ongoing study of a series of diorganotin dichelate complexes with nitrogenous bidentate ligands.

(I)
© 1999 International Union of Crystallography
Printed in Great Britain - all rights reserved

The Sn , the two Cl and the two N atoms of the bipyridyl group are coplanar, with an r.m.s. deviation of $0.013 \AA$, and this plane forms angles of 5.9 (2) and 4.1 (3) ${ }^{\circ}$ with the pyridyl rings (Fig. 1). The two planar butyl groups ( $\mathrm{C} 11-\mathrm{Cl} 2-\mathrm{C} 13-\mathrm{C} 14$ and $\mathrm{C} 15-\mathrm{C} 16-$ C17-C18) are almost perpendicular to the abovementioned basal plane of the molecule, with angles of $84.8(8)$ and $81.7(6)^{\circ}$, and form a dihedral angle of $69(1)^{\circ}$. Each pyridyl ring is planar (r.m.s. deviations of 0.003 and $0.011 \AA$ ).

Fig. 1. View of the molecule of the title compound with the atomlabelling scheme. Displacement ellipsoids are drawn at the $30 \%$ probability level. Only the major disorder component is shown, and one H atom on each of C 16 and C 18 is wholly obscured by the parent atom.

There are deviations from ideal octahedral geometry about the Sn atom, as was also observed in the case of 2,2'-bipyridyldichlorodiphenyltin (Harrison et al., 1974). The $\mathrm{C} 11-\mathrm{Sn}-\mathrm{C} 15$ angle is only $169.3(4)^{\circ}$, while the bond angles subtended at tin lie in the range 84.5 (3)$96.7(3)^{\circ}$. The $\mathrm{Cl} 1-\mathrm{Sn}-\mathrm{Cl} 2$ angle of $104.28(8)^{\circ}$ is the result of the mutual repulsion of the two Cl atoms, while the $\mathrm{N} 1-\mathrm{Sn}-\mathrm{N} 2$ angle of $67.8(2)^{\circ}$ is similar to values given in the literature (Harrison et al., 1974; Kabanos et al., 1992).
The difference in the $\mathrm{Sn}-\mathrm{Cl} 1$ and $\mathrm{Sn}-\mathrm{Cl} 2$ bond lengths is probably due to a specific intermolecular interaction involving the H atom attached to C 2 and the Cl 2 atom of a symmetry-related molecule; the $\mathrm{C} 2 \cdots \mathrm{Cl2}(-1+x, y, z)$ separation is 3.598 (8) $\AA$ and the $\mathrm{C} 2-\mathrm{H} 2 \cdots \mathrm{Cl} 2$ angle has a value of $166^{\circ}$.

## Experimental

The title compound was prepared by addition of a benzene solution of $2,2^{\prime}$-bipyridyl to a benzene solution of dibutyltin dichloride. Crystals suitable for X-ray analysis were obtained from hot benzene (Harrison et al., 1974).
