Abstract

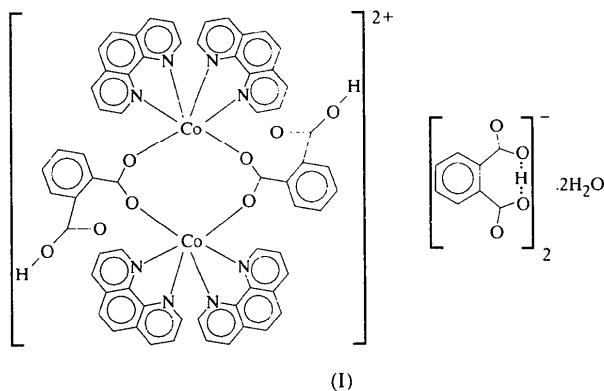

The structure of the title compound, [Co₂(C₈H₅O₄)₂·(C₁₂H₈N₂)₄](C₈H₅O₄)₂·2H₂O, consists of centrosym-

† Current address: Laboratory of Theoretical Physics and Condensed Matter Physics, Institute of Nuclear Sciences 'Vinča', 11001 Belgrade, PO Box 522, Yugoslavia.

metric dimeric [Co₂(μ-C₈H₅O₄)₂(C₁₂H₈N₂)₄]²⁺ complex units, hydrogen benzene-1,2-dicarboxylate (C₈H₅O₄⁻) counter-ions and water solvate molecules. The Co^{II} ions display a distorted octahedral environment, with Co—N distances in the range 2.134(2)–2.170(3) Å, and Co—O distances of 2.066(2) and 2.082(2) Å. A short intramolecular hydrogen bond is found in the uncoordinated C₈H₅O₄⁻ ions, with an O···O distance of 2.381(7) Å. The cations, anions and water molecules are connected by three O—H···O hydrogen bonds of 2.530(4), 2.698(6) and 2.805(4) Å.

Comment

Numerous transition metal benzene-1,2-dicarboxylato(2-) (phthalato) complexes have been described in the literature (*e.g.* Bakalbassis & Terzis, 1994; Poletti *et al.*, 1990, and references therein). Of the few hydrogen benzene-1,2-dicarboxylate(1-) (Hbdc) compounds which have been structurally characterized, the Hbdc ion in [Ni(Hbdc)₂(H₂O)₄]·2H₂O acts as a monodentate ligand (Adiwidjaja & Küppers, 1976), while in the case of [Cu(Hbdc)₂(H₂O)₂], Hbdc is a chelating ligand (Biagini Cingi *et al.*, 1969; Bartl & Küppers, 1980). In [Cu{SC(NH₂)₂}₃](Hbdc) (Biagini Cingi *et al.*, 1977), Hbdc ions are also not coordinated, but are only hydrogen bonded to the complex cation. In [Cu(N₃)Hbdc]_n·nH₂O (Escuer *et al.*, 1997), there is an infinite polymeric structure with the Hbdc ion in a bridging role. Continuing the study of this ligand, the title complex, (I), has been characterized and its crystal structure is presented here.

In the structure of (I), two Hbdc ions are also in a bridging role and each Co^{II} ion is surrounded by four N atoms from two 1,10-phenanthroline (phen) ligands and two O atoms from two Hbdc ions (Fig. 1). Ionized COO⁻ groups bridge the Co^{II} ions, thus connecting two Co(phen)₂ moieties to form centrosymmetric dimeric [Co₂(μ-C₈H₅O₄)₂(C₁₂H₈N₂)₄]²⁺ units. The geometry about Co^{II} is distorted octahedral (Table 1).

Bond distances and angles in the phen ligands and the coordinated Hbdc ions are as expected for this type of ligand (Nishigaki *et al.*, 1978; Poletti *et al.*, 1990). All

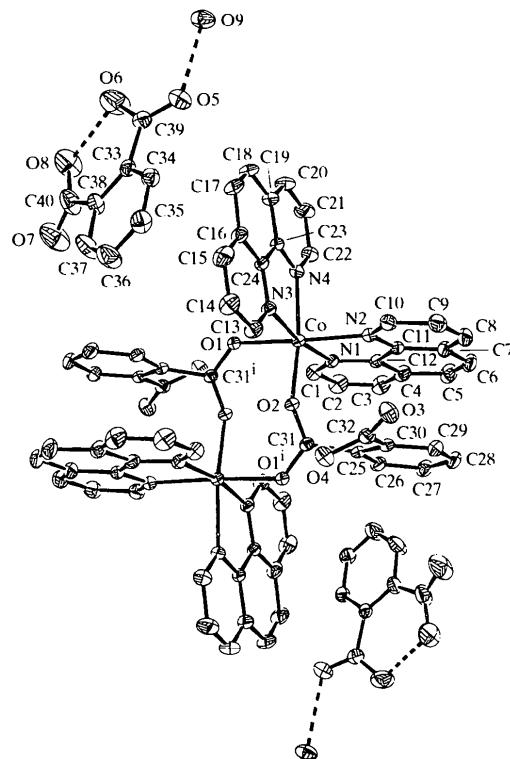

Fig. 1. A view of the molecular structure of (I), showing the atom-numbering scheme and 20% probability displacement ellipsoids. H atoms have been omitted for clarity. Selected hydrogen bonds are shown as dashed lines. Only the first neighbours in the centrosymmetric cation are numbered [symmetry code: (i) -x, -y, -z].

individual aromatic rings and the whole of each phen ligand are reasonably planar [the maximum deviation is 0.050(4) Å for C8, but does not exceed 0.033(4) Å in the other phen and 0.018(3) Å in the Hbdc ions]. Probably because of the stress caused by coordination and hydrogen bonding (see below), C31 and C32 lie out of the plane of their benzene ring by 0.135(3) and -0.146(3) Å, respectively; in contrast, the analogous C39 and C40 atoms in the uncoordinated Hbdc are coplanar with their benzene ring. The two phen planes are almost perpendicular [85.46(5)^o] to each other, while the benzene rings of the coordinated Hbdc ions are practically parallel [1.63(9)^o] to the N1–C12 phen ligand.

The orientation of COO⁻ groups in the two types of Hbdc ions is quite different: those in the coordinated ions are rotated around their C—C bonds in the same direction [dihedral angle 61.7(3)^o], while those in the uncoordinated Hbdc are rotated in opposite directions [dihedral angle 30.5(5)^o].

A short intramolecular hydrogen bond with an O6···O8 distance of 2.381(7) Å is found in the uncoordinated Hbdc ions. The H atom involved in this hydrogen bond was found as a wide peak in a difference map and after taking into account the carboxyl dimensions

and anisotropy, we allowed for this as 0.5 occupancy riding H atoms, one on each of O6 and O8.

Three intermolecular hydrogen bonds also exist in the structure (Table 2). The water molecule (O9) acts as both a hydrogen-bond donor and a hydrogen-bond acceptor, bridging the coordinated Hbdc ions. Thus, centrosymmetric 12-membered rings are formed and neighbouring dimeric cations are further dimerized by hydrogen bonds. The second water H atom is directed toward the uncoordinated Hbdc ion.

Experimental

Crystals of (I) were prepared by the slow evaporation of a dilute EtOH–H₂O (1:5) solution (pH = 3.84) containing Co(NO₃)₂, 1,10-phenanthroline and KC₈H₅O₄ in a 1:1:2 molar ratio. Analysis calculated for C₄₀H₂₈CoN₄O₉: C 62.6, H 3.7, Co 7.7, N 7.3%; found: C 62.5, H 3.6, Co 8.1, N 7.6%.

H atoms connected to carbon were placed at calculated positions using a riding model [C—H = 0.93 Å and *U*_{iso}(H) = 1.2*U*_{eq}(C)]. In the uncoordinated Hbdc ion, two half-occupancy H atoms were placed one on each of O6 and O8 and treated as riding using the SHELXL97 AFIX147 option (Sheldrick, 1997) [O—H = 0.82 Å and *U*_{iso}(H) = 1.2*U*_{eq}(O)]. The H atoms from the H₂O molecule and the COOH group in the coordinated Hbdc ion were refined isotropically.

Data collection: CAD-4 Software (Enraf–Nonius, 1989). Cell refinement: CAD-4 Software. Data reduction: local modification of MolEN (Fair, 1990). Program(s) used to solve structure: SHELXS86 (Sheldrick, 1990). Program(s) used to refine structure: SHELXL97. Molecular graphics: ORTEP7e (McArdle, 1995; Burnett & Johnson, 1996). Software used to prepare material for publication: SHELXL97.
