#### Abstract

The asymmetric unit of the title compound, $\operatorname{bis}(\mu$ 2 - hydroxybenzoato- $O^{1}, O^{2}: O^{2}$ )bis [ $\left(2,2^{\prime}\right.$ - bipyridyl$\left.N, N^{\prime}\right)$ copper(II)]-acetylsalicylic acid-water (1/1/2), $\left[\mathrm{Cu}_{2}\left(\mathrm{C}_{7} \mathrm{H}_{4} \mathrm{O}_{3}\right)_{2}\left(\mathrm{C}_{10} \mathrm{H}_{8} \mathrm{~N}_{2}\right)_{2}\right] \cdot \mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}$, contains a binuclear copper complex, one acetylsalicylic acid molecule and two water molecules. Both crystallographically independent $\mathrm{Cu}^{\mathrm{II}}$ atoms of the mixed binuclear unit show analogous distorted elongated square-pyramidal coordination (of the type $4+1$ ). Each $\mathrm{Cu}^{\mathrm{II}}$ atom is surrounded by one $2,2^{\prime}$-bipyridyl chelate and two salicylate

anions. The crystal packing is characterized by several intermolecular hydrogen bonds.

## Comment

Copper(II) complexes with non-steroidal anti-inflammatory drugs (NSAIDs) have been studied extensively since Sorenson (1976) demonstrated that they are more active than their parent drugs and exhibit an anti-ulcer activity. Sorenson also showed that 3,5 -diisopropylsalicylic acid which is an inactive agent becomes a potent anti-inflammatory compound when it chelates to copper(II). Moreover, binary complexes of $\mathrm{Cu}^{11}$ with $3,5-$ disubstituted salicylates and ternary complexes containing phenanthrolines have been prepared and characterized by Randford et al. (1993). These complexes have been tested for antiviral and cytotoxic activities; ternary complexes were ten times as cytotoxic as their binary analogues.

The crystal and molecular structure of the title compound, (I), has been determined in connection with investigations of binary complexes formed by $\mathrm{Cu}^{\mathrm{II}}$ salts with some NSAIDs as indomethacin (Guessous et al., 1998) and niflumic acid (Greenaway et al., 1999) in our department. Following the work of Randford, we decided to synthesize and characterize ternary complexes of $\mathrm{Cu}^{\text {II }}$ with acetylsalicylic acid and heteroaromatic nitrogen bases ( 1,10 -phenanthroline or bipyridine). Their biological activities will be tested and described elsewhere. The title compound consists of a binuclear copper complex, one acetylsalicylic acid and two water molecules. The two Cu atoms are crystallographically independent and present a similar environment. Each $\mathrm{Cu}^{11}$ atom is surrounded by one $2,2^{\prime}$ bipyridyl chelate via $N, N^{\prime}$ atoms, and two salicylate anions (obtained by deacetylation of acetylsalicylate during the synthesis). Each salicylate anion is bidentate via the carboxylate and hydroxyl groups [average bond length 1.895 (2) $\AA$ ] ; moreover, this hydroxyl group is bonded to the second Cu atom [average length 2.428 (3) $\AA$ ] and so the salicylato anion acts as a bridging ligand between the Cu atoms [average angle $\mathrm{Cu}-$ $\mathrm{O}-\mathrm{Cu}^{\prime} 94.34(9)^{\circ}{ }^{\circ}$.

The $\mathrm{Cu}-\mathrm{N}$ bond lengths are all equivalent [average 1.994 (2) $\AA$ ]. So the coordination polyhedron around each Cu atom is a distorted square pyramid. The Cu and $\mathrm{Cu}^{\prime}$ atoms are, respectively, 0.082 (1) $\AA$ below and

Fig. 1. Perspective view of the asymmetric unit of (I) showing the atomic numbering, with hydrogen bonds as dashed lines. Ellipsoids are at the $50 \%$ probability level for non- H atoms.
$0.098(1) \AA$ above the approximate basal plane $\mathrm{P}(1)$ ( $\mathrm{O} 21, \mathrm{O} 23, \mathrm{~N} 1, \mathrm{~N} 10$ ) or $\mathrm{P}(2)\left(\mathrm{O}_{2} 1^{\prime}, \mathrm{O}_{2} 3^{\prime}, \mathrm{N1}^{\prime}, \mathrm{N} 10^{\prime}\right)$, toward the apical atom ( $\mathrm{O} 23^{\prime}$ or O 23 ) belonging to the hydroxyl groups of the salicylate anions. The bonds $\mathrm{Cu}-\mathrm{O} 23^{\prime}$ and $\mathrm{Cu}^{\prime}-\mathrm{O} 23$ only deviate by $6.0(1)^{\circ}$ from the perpendicular to the mean planes $\mathrm{P}(1)$ and $\mathrm{P}(2)$. The outlines $\mathrm{O} 21-\mathrm{C} 21-\mathrm{C} 22-\mathrm{C} 23-\mathrm{O} 23, \mathrm{P}(3)$, and $\mathrm{O} 21^{\prime}-\mathrm{C} 21^{\prime}-\mathrm{C} 22^{\prime}-\mathrm{C} 23^{\prime}-\mathrm{O} 23^{\prime}, \mathrm{P}(4)$, have planar geometries with a dihedral angle of $6.3(1)^{\circ} ; \mathrm{Cu}$ and $\mathrm{Cu}^{\prime}$ are displaced 0.316 (3) and 0.460 (3) $\AA$, respectively, out of these planes. The dihedral angles between $\mathrm{P}(1)$ or $P(2)$ and their benzene ring are $20.5(1)$ and $28.7(1)^{\circ}$. The distances and angles within the $2,2^{\prime}$-bipyridyl ligands do not differ from those found in the literature. Their mean planes are quasi-parallel [dihedral angle $4.50(8)^{\circ}$ ]. The distances and angles within the acetylsalicylic acid solvate are analogous to those observed in the molecule of aspirin (Wheatley, 1964), the largest difference involving C51-O51 [1.235 (4) $\AA$ in aspirin itself and 1.194 (4) $\AA$ in (I)]. The crystal packing is characterized by several intermolecular hydrogen bonds, the shortest involving the acid hydrogen of the aspirin and one of the two water molecules [O52-H52 . OW1 $2.541(3) \AA$ and $168(3)^{\circ}$ ]. In addition, the crystalline cohesion is likewise ensured by many van der Waals contacts, the shortest being 3.234 (5) A.

## Experimental

The sodium salt of acetylsalicylic acid was prepared by dissolving acetylsalicylic acid ( 0.1 mol ) in $\mathrm{H}_{2} \mathrm{O}$ with NaOH so that the final pH of the solution was about 9 ; bipyridine ( 0.1 mol ) was then dissolved in it. This mixture was added to a stirred aqueous solution of $\mathrm{CuCl}_{2}(0.1 \mathrm{~mol})$. After heating ( $<343 \mathrm{~K}$ ) and stirring for 2 h , the precipitate was separated. Single crystals were obtained by slow evaporation of the filtrate under ambient pressure.

# 3-Hydroxyphthalide and its adduct with dibutyltin oxide 

Lian Ee Khoo ${ }^{a}$ and Alan Hazell ${ }^{b}$<br>${ }^{a}$ School of Science, Nanyang Technological University, 469 Bukit Timah Road, Singapore 25976, Singapore, and ${ }^{b}$ Department of Chemistry, Aarhus University, Langelandsgade 140, DK-8000 Århus C, Denmark. #### Abstract

3-Hydroxyphthalide, $\mathrm{C}_{8} \mathrm{H}_{6} \mathrm{O}_{3}$, reacts with dibutyltin oxide to give bis $\left\{\mu_{3}\right.$-oxo-( $\mu$-2-formylbenzoato- $O: O^{\prime}$ )-(2-formylbenzoato-O) bis[dibutyltin(IV)]\}, $\left[\mathrm{Sn}_{4}\left(\mathrm{C}_{4} \mathrm{H}_{9}\right)_{8}\right.$ $\left(\mathrm{C}_{8} \mathrm{H}_{5} \mathrm{O}_{3}\right)_{4}(\mu-\mathrm{O})_{2}$ ], in which the four Sn atoms are all five-coordinated to three O and two C atoms arranged at the corners of a distorted trigonal bipyramid. The equatorial $\mathrm{Sn}-\mu_{3}-\mathrm{O}$ distances are in the range $2.039(2)-$ 2.048 (2) $\AA$ and are significantly shorter than the axial $\mathrm{Sn}-\mu_{3}-\mathrm{O}$ distances of 2.170 (3) and 2.182 (2) A. The $\mathrm{Sn}-\mathrm{O}_{\text {carboxylate }}$ bonds are all axial and have distances in the range 2.204 (3) -2.271 (3) $\AA$, which are inversely correlated with the respective $\mathrm{C}-\mathrm{O}$ bond distances. The mean $\mathrm{Sn}-\mathrm{C}$ distance is 2.136 (6) $\AA$. 3-Hydroxyphthalide undergoes ring opening to give the anion of 2 -formylbenzoic acid which bonds to the Sn atoms. The structure of 3-hydroxyphthalide is stabilized by O $\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds $[\mathrm{O} \cdots \mathrm{O}=2.766(1) \AA$ ] which link the molecules in a zigzag chain parallel to $\mathbf{b}$.

## Comment

The reaction between $o$-substituted aromatic carboxylic acids with diorganotin oxide yields two types of diorganotin carboxylate, i.e. with a $2: 1$ or a $1: 1$ ligandtin ratio (Gielen et al., 1992, 1993). As a continuation of our studies of the structure-activity relationship (Goh et al., 1998), we report the structures of the prod-

(I)
