In the title complex,  $[\text{Co}(\text{CH}_3\text{CN})_2(\text{H}_2\text{O})_4]\text{Br}_2$ , the  $\text{Co}^{\text{II}}$  atom lies on an inversion centre and is octahedrally coordinated by two *trans* acetonitrile molecules and four water molecules. Hydrogen bonding between the water molecules and lattice bromide ions yields a three-dimensional structure.

### Comment

Despite there being numerous acetonitrile- and aqua-metal complexes reported in the literature, *trans*-bis(acetonitrile-*N*)tetraaquacobalt(II) dibromide, (I), is the first reported structure of a metal complex where the ligands are exclusively

Figure 1

ORTEP-3 (Farrugia, 1997) diagram of  $[\text{Co}(\text{CH}_3\text{CN})_2(\text{H}_2\text{O})_4]^{2+}$  with displacement ellipsoids drawn at the 50% probability level and H atoms of arbitrary size. Unlabelled atoms are related to labelled atoms by the inversion centre at Co1.

bond lengths of 2.073 (4) and 2.114 (5) Å, which the authors attributed to different constraints imposed by hydrogen-bonding linkages (de Meester & Skapski, 1973).

All the coordinated water H atoms form hydrogen bonds to adjacent bromide ions, creating a three-dimensional network (Fig. 2 and Table 2). Each bromide ion forms four hydrogen bonds in a distorted tetrahedral arrangement to different  $[\text{Co}(\text{CH}_3\text{CN})_2(\text{H}_2\text{O})_4]^{2+}$  cations with H···Br distances consistent with the reported distances of 2.30–2.68 Å (Mikenda, 1986; Tegenfeldt *et al.*, 1979; Sieron & Bukowska-Strzyzewska, 1997). Three of the O—H···Br angles are close to the most probable angle of 160° for a two-centre hydrogen bond (Jeffrey *et al.*, 1985) while the fourth makes a smaller angle at the H atom, 135 (10)°, but with the Br···O contact the smallest at 3.283 (6) Å. The Br···O distances range from 3.283 (6) to 3.315 (6) Å compared with previously observed values between 3.195 (6) and 3.421 (3) Å (Kepert *et al.*, 1996; Sieron & Bukowska-Strzyzewska, 1997; Cunningham *et al.*, 1991).

Figure 2

The three-dimensional network of O—H···Br bonds in the structure of  $[\text{Co}(\text{CH}_3\text{CN})_2(\text{H}_2\text{O})_4]\text{Br}_2$  viewed down the *a* axis, with the *b* axis to the right. Some link atoms have been omitted for clarity.

coordinated water and acetonitrile molecules. The cobalt(II) atom lies on a centre of symmetry and is coordinated to two *trans* acetonitrile molecules and to four water molecules (Fig. 1). The metal coordination is close to octahedral (Table 1), with the maximum deviation ( $X-\text{Co}-Y$ ) from 90° being 3.7 (2)°. The mean Co—O length, 2.063 Å, is consistent with reported Co—OH<sub>2</sub> distances of tetraaqua complexes (2.060–2.124 Å) (Abrahams *et al.*, 1996; de Meester & Skapski, 1973; Salas *et al.*, 1992). Variations in the two Co—O bond lengths [0.15 (7) Å], although here barely significant, have been observed previously in tetraaquacobalt(II) complexes; for example, *trans*-tetraaquabis(adenine)cobalt(II) has Co—O

As expected, the acetonitrile molecule is linear [N1—C1—C2 = 179.0 (6)°], but with bent coordination to the cobalt(II) [Co—N1—C1 = 165.0 (4)°]. Such coordination has been observed in polymeric Co(O<sub>2</sub>PF<sub>2</sub>)<sub>2</sub>(CH<sub>3</sub>CN)<sub>2</sub> [164.4°; Begley *et al.*, 1985]. Metal–acetonitrile bent coordination is indeed quite common with angles from 145.2 to 176.9°, and an average of 167°, having been reported (Agterberg *et al.*, 1998; Begley *et al.*, 1985; Chisholm *et al.*, 1996; Holligan *et al.*, 1992; Libby *et al.*, 1993). This average is somewhat lowered by the two extremely low values for nickel(II) (Holligan *et al.*, 1992) (145.2°) and manganese(III) (Libby *et al.*, 1993) (149.1°) complexes, which have been attributed to hydrogen bonding and steric effects, respectively.

### Experimental

Crystals of [Co(CH<sub>3</sub>CN)<sub>2</sub>(H<sub>2</sub>O)<sub>4</sub>]Br<sub>2</sub> were obtained after unintentional co-extraction of excess CoBr<sub>2</sub> with CH<sub>2</sub>Cl<sub>2</sub> from the reaction of excess CoBr<sub>2</sub> with hexakis(2-pyridyloxy)cyclotriphosphazene (prior to extraction with CH<sub>2</sub>Cl<sub>2</sub>, CH<sub>3</sub>CN solvent was evaporated from the reaction mixture).

#### Crystal data

[Co(CH <sub>3</sub> CN) <sub>2</sub> (H <sub>2</sub> O) <sub>4</sub> ]Br <sub>2</sub>	Z = 2
M <sub>r</sub> = 372.92	D <sub>x</sub> = 1.917 Mg m <sup>-3</sup>
Monoclinic, P2 <sub>1</sub> /c	Mo Kα radiation
a = 6.843 (4) Å	μ = 7.502 mm <sup>-1</sup>
b = 12.553 (7) Å	T = 158 (2) K
c = 8.076 (5) Å	Block, pale brown
β = 111.370 (8)°	0.44 × 0.22 × 0.16 mm
V = 646.0 (6) Å <sup>3</sup>	

#### Data collection

CCD area-detector diffractometer	1313 independent reflections
φ and ω scans	925 reflections with I > 2σ(I)
Absorption correction: multi-scan	R <sub>int</sub> = 0.056
[SAINT (Siemens, 1994) and SADABS (Sheldrick, 1996)]	θ <sub>max</sub> = 26.4°
T <sub>min</sub> = 0.151, T <sub>max</sub> = 0.301	h = -8 → 7
4724 measured reflections	k = -6 → 15
	l = -9 → 10

#### Refinement

Refinement on F <sup>2</sup>	H atoms treated by a mixture of independent and constrained refinement
R(F) = 0.038	w = 1/[σ <sup>2</sup> (F <sub>o</sub> <sup>2</sup> ) + (0.0515P) <sup>2</sup> ]
wR(F <sup>2</sup> ) = 0.087	where P = (F <sub>o</sub> <sup>2</sup> + 2F <sub>c</sub> <sup>2</sup> )/3
S = 0.904	(Δ/σ) <sub>max</sub> = 0.004
1313 reflections	Δρ <sub>max</sub> = 1.050 e Å <sup>-3</sup>
78 parameters	Δρ <sub>min</sub> = -0.523 e Å <sup>-3</sup>

**Table 1**

Selected geometric parameters (Å, °).

Co1—O2	2.056 (5)	N1—C1	1.125 (6)
Co1—O1	2.071 (5)	C1—C2	1.454 (7)
Co1—N1	2.112 (4)		
O2—Co1—O1	90.3 (2)	O1 <sup>i</sup> —Co1—N1	89.13 (19)
O2—Co1—N1	86.34 (18)	C1—N1—Co1	164.9 (4)
O1—Co1—N1	90.87 (19)	N1—C1—C2	179.2 (6)

Symmetry code: (i) 1 - x, -y, -z.

**Table 2**

Hydrogen-bonding geometry (Å, °).

D—H...A	D—H	H...A	D...A	D—H...A
O1—H11...Br1	0.98 (7)	2.38 (6)	3.315 (6)	161 (5)
O1—H12...Br1 <sup>i</sup>	0.64 (7)	2.65 (7)	3.295 (6)	175 (7)
O2—H21...Br1 <sup>ii</sup>	0.88 (7)	2.42 (7)	3.289 (5)	169 (7)
O2—H22...Br1 <sup>iii</sup>	0.76 (10)	2.70 (11)	3.283 (6)	135 (10)

Symmetry codes: (i) x, ½ - y, z - ½; (ii) x, ½ - y, ½ + z; (iii) 2 - x, y - ½, ½ - z.

The H atoms bound to O1 and O2 were located from a difference Fourier synthesis and refined unrestrained; methyl-H atoms are in calculated positions. The residual electron-density maximum is 0.97 Å from Br1.

Data collection: SMART (Siemens, 1996); cell refinement: SMART; data reduction: SAINT (Siemens, 1994) and SADABS (Sheldrick, 1996); program(s) used to solve structure: SHELXS97 (Sheldrick, 1997a); program(s) used to refine structure: SHELXL97 (Sheldrick, 1997b); molecular graphics: WINGX (Farrugia, 1998), ORTEP-3 (Farrugia, 1997) and PLATON (Spek, 1990).

Supplementary data for this paper are available from the IUCr electronic archives (Reference: TA1257). Services for accessing these data are described at the back of the journal.
