In the title compound, $\left[\mathrm{Cu}\left(\mathrm{C}_{5} \mathrm{H}_{10} \mathrm{NO}_{2} \mathrm{~S}_{2}\right)\left(\mathrm{C}_{18} \mathrm{H}_{15} \mathrm{P}\right)_{2}\right] \cdot \mathrm{C}_{18} \mathrm{H}_{15} \mathrm{P}$, the Cu atom is in a distorted tetrahedral coordination, with two triphenylphosphine P atoms and two S atoms from an $N, N$-bis(2-hydroxyethyl)dithiocarbamate ligand occupying the vertices. The crystal structure is characterized by alternate layers of complex and triphenylphosphine molecules.

## Comment

Group 12 metals form a wide range of tertiary phosphine $\left(R_{3} \mathrm{P}\right)$ complexes of the general stoichiometry $L_{n} M X\left(L=R_{3} \mathrm{P}\right.$, $n=1-4$; Attar, Alcock, Frye et al., 1991; Attar, Alcock, Bowmaker et al., 1991; Alyea et al., 1992). The value of $n$ and the net electronic charge on the complex are somewhat dependent upon the coordinating ability of $X$. Also, the transition metal dithiolates containing $M \mathrm{~S}_{4}$ chromophores show interesting variations in their reactions with Lewis bases (Cordes \& Draganjac, 1988; Venkatachalam et al., 1996).

The asymmetric unit of the title structure, (I), contains one molecule of $\left[\mathrm{Cu}\left\{\left(\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{OH}\right)_{2} \mathrm{~S}_{2} \mathrm{CN}\right\}\left(\mathrm{PPh}_{3}\right)_{2}\right]$ together with a molecule of uncoordinated triphenylphosphine. The Cu 1 atom is in a distorted tetrahedral environment, with the P atoms of the triphenylphosphine ligands and the $S$ atoms of the bidentate dithiocarbamate ligand occupying the vertices. The angles around Cu 1 range between 74.77 (4) ( $\mathrm{S} 1-\mathrm{Cu} 1-\mathrm{S} 2$ ) and $124.51(4)^{\circ}(\mathrm{P} 1-\mathrm{Cu} 1-\mathrm{P} 2)$. The small $\mathrm{S} 1-\mathrm{Cu} 1-\mathrm{S} 2$ bond angle is due to the restricted bite angle of the ligand. The P1$\mathrm{Cu} 1-\mathrm{P} 2$ bond angle is comparable with values reported for other bis(triphenylphosphine)copper(I) compounds (Kara-
glannidis et al., 1989; Long et al., 1996). The $\mathrm{Cu}-\mathrm{P}$ distances are comparable to those found in $\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cu}\left(\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{~N}_{2} \mathrm{~S}_{2}\right) \mathrm{Br}$ (Long et al., 1996). The bond lengths of $\mathrm{Cu}-\mathrm{S} 1$ and $\mathrm{S} 2-\mathrm{C} 37$ are longer than those of $\mathrm{Cu}-\mathrm{S} 2$ and $\mathrm{S} 1-\mathrm{C} 37$, respectively. One of the $\mathrm{S}-\mathrm{C}$ bond lengths ( $\mathrm{S} 1-\mathrm{C} 37$ ) is close to the $\mathrm{C}=\mathrm{S}$ distance of $1.69 \AA$, while $\mathrm{S} 2-\mathrm{C} 37$ shows a value intermediate between single- and double-bond distances, indicating partial double-bond character. The longer $\mathrm{Cu}-\mathrm{S}$ bond length ( $\mathrm{Cu} 1-$ S 1 ) lies adjacent to $\mathrm{C}-\mathrm{S}$ bond which is closer to the $\mathrm{C}=\mathrm{S}$ bond distance. The same characteristic is found in the structure of $\left[\mathrm{Ni}(\right.$ pipdtc $\left.)\left(\mathrm{PPh}_{3}\right)_{2}\right] \mathrm{ClO}_{4}\left(\mathrm{PPh}_{3}\right) \cdot \mathrm{H}_{2} \mathrm{O} \quad$ (pipdtc is piperidinedithiocarbamate; Venkatachalam et al., 1996), but different from the complex of $\left[\mathrm{Au}\left(\mathrm{S}_{2} \mathrm{CPh}\right)\left(\mathrm{PPh}_{3}\right)_{2}\right]$ (Lanfredi et al., 1992), where the shorter $\mathrm{Au}-\mathrm{S}$ bond lies adjacent to the $\mathrm{C}-\mathrm{S}$ bond length which is closer to the $\mathrm{C}=\mathrm{S}$ bond distance. The four-membered $\mathrm{CuS}_{2} \mathrm{C}$ is nearly planar with normal bond lengths. The bond length of C37-N1 [1.360 (4) A ] has double-bond character, but slightly longer than those observed in a related structure (Jian et al., 1999). All the phenyl rings show normal bond parameters. The $\mathrm{P}-\mathrm{C}$ bond distances are also normal. The $\mathrm{C}-\mathrm{P}-\mathrm{C}$ angles deviate appreciably from the ideal tetrahedral angle of $109.5^{\circ}$. The crystal structure is characterized by alternate layers of the complexes and the triphenylphosphine ligands which lie parallel to the $b c$ plane. The structure is stabilized by $\mathrm{C}-$ $\mathrm{H} \cdots \pi$ and van der Waals interactions (Table 2).

## Experimental

Sodium $N, N$-bis(2-hydroxyethyl)dithiocarbamate, $\mathrm{Na}\left[\mathrm{S}_{2} \mathrm{CN}\left(\mathrm{C}_{2} \mathrm{H}_{4}-\right.\right.$ $\mathrm{OH})_{2}$ ], was dissolved in $\mathrm{H}_{2} \mathrm{O} . \mathrm{CuCl}_{2}$ was then added at room temperature with stirring. The brown reaction mixture was filtered and the filtrate was washed with water and dried overnight in vacuo. The dried brown solid was dissolved in EtOH and triphenylphosphine was added at $253-263 \mathrm{~K}$ with stirring and the resulting solution refluxed for $4-5 \mathrm{~h}$. Upon cooling, the colourless solution obtained was filtered and left to evaporate. After a few days, colourless solids were separated out and recrystallized from $\mathrm{EtOH} /$ $\mathrm{CHCl}_{3}$. Single crystals suitable for X-ray analysis were obtained by slow evaporation at room temperature of the EtOH solvent.
