The title compound [alternative name: 8 -methyl- 8 -azabi-cyclo[3.2.1]octan-3-ylmethyl $p$-toluenesulfonate $\left(N^{8}-B\right)$-borane], $\mathrm{C}_{16} \mathrm{H}_{26} \mathrm{BNO}_{3} \mathrm{~S}$, has the tosyloxymethyl substituent in an endo position. The $\mathrm{BH}_{3}$ group is equatorial and the $(\mathrm{N}-$ bonded) methyl group is axial, relative to the six-membered heterocycle. The N-B bond of 1.649 (8) $\AA$ is one of the longest known.

## Comment

$3 \alpha$-Tosyloxymethyltropane has been synthesized by Murr et al. (1992) by hydrogenation of 3-methylenetropane and tosylation of the resulting $3 \alpha$-oxymethyltropane. Repeating this process as part of a multi-stage synthetic route to littorinetype alkaloids (Tavasli, 1999), we accidentally obtained $3 \alpha$ oxymethyltropane ( $N^{8}-B$ )-borane, (II), in the first stage and $3 \alpha$-tosyloxymethyltropane ( $N^{8}-B$ )-borane, (I), in the second.

(I)

According to the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data, both (I) and (II) formed as $1: 1$ mixtures of two isomers. One isomer of (I) was isolated and studied in the present work.

The molecule has an endo configuration at C 3 . The $\mathrm{BH}_{3}$ substituent at the N atom is equatorial and the methyl one axial with respect to the six-membered heterocycle (the opposite may be the case for the unidentified second isomer). A survey of the April 2000 release of the Cambridge Structural Database (Allen \& Kennard, 1993) yielded 24 structures containing an $\mathrm{N}-\mathrm{B}$ bond between a tertiary amine and a $\mathrm{BH}_{3}$ group, the bond distance ranging from 1.60 to $1.66 \AA$ and

[^0]averaging $1.625 \AA$. Thus, the $\mathrm{N}-\mathrm{B}$ bond distance of 1.649 (8) $\AA$ in (I) is relatively long, probably due to steric overcrowding.

## Experimental

$\mathrm{HB}(\mathrm{CHMeCHMe} 2)$ was prepared by addition of $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$ ( 26.7 mmol ) to a solution of $\mathrm{NaBH}_{4}(20 \mathrm{mmol})$ and 2-methyl-2butene ( 53.4 mmol ) in THF ( 10 ml ). 3-Methylenetropane ( 4.5 mmol ) was then added to the solution and the reaction stirred for 16 h at room temperature. A $30 \%$ solution of basic peroxide $\left(\mathrm{NaOH} / \mathrm{H}_{2} \mathrm{O}_{2}\right)$ in ethanol $(8 \mathrm{ml})$ was added and the reaction stirred for another 4 h at 333 K . The mixture was then diluted with water and ether, filtered and the organics were extracted into ether, concentrated in vacuo and the products purified over silica gel, yielding (II) $(70 \mathrm{mg}, 10 \%)$ as a pale-yellow oil. A 1.6 M solution of $n$-BuLi ( 2.8 mmol ) in hexane was added to a mixture of 2.6 mmol of (II) and 2 mg of $\mathrm{Ph}_{3} \mathrm{CH}$ in THF $(10 \mathrm{ml})$ at 273 K and the reaction was stirred for 15 min . A solution of tosyl chloride ( 2.6 mmol ) in THF ( 5 ml ) was then added and the mixture was stirred for 3.5 h at 273 K , diluted with $\mathrm{Et}_{2} \mathrm{O}$ and washed with brine. After concentrating the organics in vacuo, a mixture of isomers of (I) was obtained as a white amorphous solid. One isomer was separated by chromatography on silica gel and recrystallized from petroleum ether ( $55 \mathrm{mg}, 8 \%$ ).

## Crystal data

$\mathrm{C}_{16} \mathrm{H}_{26} \mathrm{BNO}_{3} \mathrm{~S}$
$\mathrm{Cu} K \alpha$ radiation
$M_{r}=323.25$
Orthorhombic, $\mathrm{Pna2}_{1}$
$a=21.443$ (2) $\AA$
$b=7.959$ (1) $\AA$
$c=10.224$ (2) A
$V=1744.9(4) \AA^{3}$
$Z=4$
Cell parameters from 25 reflections
$\theta=20.5-25.2^{\circ}$
$\mu=1.731 \mathrm{~mm}^{-1}$
$T=293$ (2) K
Prism, colourless
$0.28 \times 0.22 \times 0.11 \mathrm{~mm}$
$D_{x}=1.230 \mathrm{Mg} \mathrm{m}^{-3}$

1613 reflections with $I>2 \sigma(I)$
Rigaku AFC-6S four-circle diffractometer
$2 \theta / \omega$ scans
Absorption correction: analytical
(de Meulenaer \& Tompa, 1965)
$T_{\text {min }}=0.726, T_{\text {max }}=0.837$
2243 measured reflections
2157 independent reflections (see below)

## Refinement

Refinement on $F^{2}$

$$
\begin{aligned}
& w=1 /\left[\sigma^{2}\left(F_{o}{ }^{2}\right)+(0.0473 P)^{2}\right. \\
& +0.4507 P] \\
& \text { where } P=\left(F_{o}{ }^{2}+2 F_{c}^{2}\right) / 3 \\
& (\Delta / \sigma)_{\max }=-0.001 \\
& \Delta \rho_{\text {max }}=0.21 \mathrm{e}^{\text {A }}{ }^{-3} \\
& \Delta \rho_{\min }=-0.17 \mathrm{e}^{\AA^{-3}} \\
& \text { Absolute structure: Flack (1983) } \\
& \text { Flack parameter }=0.35 \text { (3) }
\end{aligned}
$$

## Table 1

Selected geometric parameters $\left({ }^{\circ},{ }^{\circ}\right)$.

| S-O2 | $1.424(4)$ | $\mathrm{C} 1-\mathrm{C} 2$ | $1.522(6)$ |
| :--- | :--- | :--- | :--- |
| S-O3 | $1.432(4)$ | $\mathrm{C} 1-\mathrm{C} 7$ | $1.523(7)$ |
| S-O1 | $1.573(3)$ | $\mathrm{C} 2-\mathrm{C} 3$ | $1.545(6)$ |
| S-C11 | $1.745(5)$ | $\mathrm{C} 3-\mathrm{C} 9$ | $1.513(6)$ |
| $\mathrm{O} 1-\mathrm{C} 9$ | $1.467(5)$ | $\mathrm{C} 3-\mathrm{C} 4$ | $1.541(6)$ |
| $\mathrm{N}-\mathrm{C} 8$ | $1.497(7)$ | $\mathrm{C} 4-\mathrm{C} 5$ | $1.520(6)$ |

| $\mathrm{N}-\mathrm{B}$ | $1.649(8)$ |  |  |

| $\mathrm{C} 8-\mathrm{N}-\mathrm{C} 1$ | $113.3(4)$ | $\mathrm{C} 8-\mathrm{N}-\mathrm{B}$ | $106.0(4)$ |
| :--- | ---: | ---: | ---: |
| $\mathrm{C} 8-\mathrm{N}-\mathrm{C} 5$ | $112.6(4)$ | $\mathrm{C} 1-\mathrm{N}-\mathrm{B}$ | $113.1(4)$ |
| $\mathrm{C} 1-\mathrm{N}-\mathrm{C} 5$ | $99.7(3)$ | $\mathrm{C} 5-\mathrm{N}-\mathrm{B}$ | $112.3(4)$ |

1749 independent reflections and 408 of their Friedel equivalents were measured, of which 1229 and 384 , respectively, had $I>2 \sigma(I)$. The crystal was a racemic twin with component contributions of 0.65 (3) and 0.35 (3). H atoms were treated as riding and the $\mathrm{BH}_{3}$ group was treated as a 'rotating body' with the refined $\mathrm{B}-\mathrm{H}$ distance converging to $1.19 \AA$.
