In the title compound, $\left(\eta^{5}-2,5\right.$-dimethylpyrrolyl $)[(7,8,9,10,11-\eta)$ -7-methyl-7,8-dicarba-nido-undecaborato]cobalt(III), $\left[3-\mathrm{Co}\left\{\eta^{5}\right.\right.$ -$\left.\left.\left[2,5-\left(\mathrm{CH}_{3}\right)_{2}-\mathrm{NC}_{4} \mathrm{H}_{2}\right]\right\}-1-\mathrm{CH}_{3}-1,2-\mathrm{C}_{2} \mathrm{~B}_{9} \mathrm{H}_{10}\right]$ or $\left[\mathrm{Co}\left(\mathrm{C}_{3} \mathrm{H}_{13} \mathrm{~B}_{9}\right)-\right.$ $\left(\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{~N}\right)$ ], the $\mathrm{Co}^{\text {III }}$ atom is sandwiched between the pentagonal faces of the pyrrolyl and dicarbollide ligands, resulting in a neutral molecule. The $\mathrm{C}-\mathrm{C}$ distance in the dicarbollide cage is 1.649 (3) $\AA$.

## Comment

Our studies concerning 1,2-dicarba-closo-dodecaborane(12)s have shown that the $\mathrm{C} 1-\mathrm{C} 2\left(\mathrm{C}_{c}-\mathrm{C}_{c}\right)$ distance in the cage can be modified by substituting the cluster C atoms (Sillanpää et al., 1996). We have previously prepared mixed cobalt pyrrolyl/ dicarbollide closo compounds (Bertran et al., 1997; Gómez et al., 1997; Lamrani et al., 1996; Teixidor et al., 1997). It seems that from a structural point of view the cobaltacarborane cluster in these compounds resembles normal closo architecture. In order to obtain more information on the $\mathrm{C}_{c}-\mathrm{C}_{c}$ distances as a function of the $\mathrm{C}_{c}$ substituent in mixed cobalt pyrroly//dicarbollide closo compounds, the crystal structure of $\left[3-\mathrm{Co}\left\{\eta^{5}-\left[2,5-\left(\mathrm{CH}_{3}\right)_{2}-\mathrm{NC}_{4} \mathrm{H}_{2}\right]\right\}-1-\mathrm{CH}_{3}-1,2-\mathrm{C}_{2} \mathrm{~B}_{9} \mathrm{H}_{10}\right]$, (I), is now reported.

(I)

A perspective view of the title compound is shown in Fig. 1. The metal is sandwiched by pentagonal faces of the monoanionic 2,5-dimethylpyrrolyl and dianionic dicarbollide ligands so that the conformation of the faces is staggered with the pyrrolyl N13 atom being placed between the cluster C atoms. Theoretical calculations show that this is the most stable conformation for $\left[3-\mathrm{Co}\left\{\eta^{5}-\left(\mathrm{NC}_{4} \mathrm{H}_{4}\right)\right\}-1,2-\mathrm{C}_{2} \mathrm{~B}_{9} \mathrm{H}_{11}\right]$,
even though the energy difference between different rotamers is low (Teixidor et al., 2000).

Bond lengths in (I) from the five-membered rings to Co 3 are normal, varying from 2.013 (2) to 2.079 (2) $\AA$. The coordinated pentagonal faces are not exactly parallel as the dihedral angle between the planes through the faces is $6.9(1)^{\circ}$. In (I), the $\mathrm{C}_{c}-\mathrm{C}_{c}$ distance of 1.649 (3) $\AA$ agrees with the value of $1.640(7) \AA$ in $\left[3-\mathrm{Co}\left\{\eta^{5}-\left(\mathrm{NC}_{4} \mathrm{H}_{4}\right)\right\}-1,2-\mathrm{C}_{2} \mathrm{~B}_{9} \mathrm{H}_{11}\right.$ ] (Lamrani et al., 1996), but is slightly shorter than the values in the $\mathrm{C}_{c}-\mathrm{C}_{c^{-}}$ disubstituted compounds $\left[3-\mathrm{Co}\left\{\eta^{5}-\left(\mathrm{NC}_{4} \mathrm{H}_{4}\right)\right\}-1-\mathrm{CH}_{3}-2-n \mathrm{C}_{4} \mathrm{H}_{9}-\right.$ $\left.1,2-\mathrm{C}_{2} \mathrm{~B}_{9} \mathrm{H}_{9}\right][1.671$ (7) $\AA \mathrm{A}],\left[3-\mathrm{Co}\left\{\eta^{5}-\left(\mathrm{NC}_{4} \mathrm{H}_{4}\right)\right\}-1-\mathrm{C}_{6} \mathrm{H}_{5}-2-\mathrm{C}_{3} \mathrm{H}_{5}-\right.$ $\left.1,2-\mathrm{C}_{2} \mathrm{~B}_{9} \mathrm{H}_{9}\right]\left[1.737\right.$ (4) Å] (Teixidor et al., 1997) and [3-Co $\left\{\eta^{5}-\right.$ $\left.\left.\left(\mathrm{NC}_{4} \mathrm{H}_{5}\right)\right\}-1-\mathrm{CH}_{3}-2-\left(\mathrm{C}_{3} \mathrm{H}_{6} \mathrm{NC}_{4} \mathrm{H}_{4}\right)-1,2-\mathrm{C}_{2} \mathrm{~B}_{9} \mathrm{H}_{9}\right] \quad[1.692(7) \AA$; Gómez et al., 1997].

Figure 1
ORTEP-3 (Farrugia, 1997) plot of (I). Only the heavy atoms have been labelled. Displacement ellipsoids are drawn at the $30 \%$ probability level.

This observation is in line with the effect of reported $\mathrm{C}_{c}$ substituents on the lengthening of the $\mathrm{C}_{c}-\mathrm{C}_{c}$ distance for $o$-carborane derivatives. In accordance with this, the effect of $\mathrm{C}_{c}$ monosubstitution on the lengthening of the $\mathrm{C}_{c}-\mathrm{C}_{c}$ distance is smaller than that of disubstitution.

## Experimental

Compound (I) was synthesized by two methods. Method $A: 1-\mathrm{CH}_{3}-$ $1,2-\mathrm{C}_{2} \mathrm{~B}_{10} \mathrm{H}_{11}(0.20 \mathrm{~g}, 1.20 \mathrm{mmol})$ was dissolved in a suspension of $\mathrm{K}\left[2,5-\left(\mathrm{CH}_{3}\right)_{2} \mathrm{NC}_{4} \mathrm{H}_{2}\right](1.90 \mathrm{~g}, 14.3 \mathrm{mmol})$ in tetrahydrofuran (THF) $(100 \mathrm{ml})$. After 4 h of stirring under reflux, anhydrous $\mathrm{CoCl}_{2}(0.79 \mathrm{~g}$, 6.0 mmol ) was added. The reaction mixture was refluxed for a further 48 h . After cooling, the solvent was evaporated in vacuo, and the resulting dark solid was treated with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(80 \mathrm{ml})$. The suspension was filtered and the orange solution was concentrated to 1 ml . Chromatography of the crude orange solution using $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{C}_{6} \mathrm{H}_{14}$ (6:4) as the mobile phase provided a pure orange complex $\left[R_{\mathrm{F}}(\right.$ prep $)=$ 0.65 ] (yield $0.23 \mathrm{~g}, 61 \%$ ). Method $B$ : to a potassium $(0.51 \mathrm{~g}$, 13.0 mmol ) suspension in deoxygenated and dry THF ( 100 ml ), 2,5dimethylpyrrole ( $1.30 \mathrm{ml}, 13.0 \mathrm{mmol}$ ) was added. Then, $\left[\mathrm{N}\left(\mathrm{CH}_{3}\right)_{4}\right][7-$ $\left.\mathrm{CH}_{3}-7,8-\mathrm{C}_{2} \mathrm{~B}_{9} \mathrm{H}_{11}\right](0.44 \mathrm{~g}, 1.98 \mathrm{mmol})$ was incorporated into the
mixture. After 4 h of stirring under reflux, anhydrous $\mathrm{CoCl}_{2}(0.70 \mathrm{~g}$, 5.30 mmol ) was added. From this point, the work-up was as for method $A$ (yield $0.35 \mathrm{~g}, 59 \%$ ). IR (KBr, $\nu, \mathrm{cm}^{-1}$ ): $3120(\mathrm{C}-\mathrm{H}), 3029$ $(\mathrm{C}-\mathrm{H}), 2598,2538,2524(\mathrm{~B}-\mathrm{H}) .{ }^{1} \mathrm{H}$ NMR: $\delta=6.0\left(s, \mathrm{C}_{\mathrm{pyr}}-\mathrm{H}, 1 \mathrm{H}\right)$, $5.8\left(s, \mathrm{C}_{\mathrm{pyr}}-\mathrm{H}, 1 \mathrm{H}\right), 3.9\left(b r s, \mathrm{C}_{c}-\mathrm{H}, 1 \mathrm{H}\right), 3.5-1.0(b r, \mathrm{~B}-\mathrm{H}), 2.4(s$, $\left.\mathrm{C}_{\mathrm{pyr}}-\mathrm{CH}_{3}, 6 \mathrm{H}\right), 2.3\left(s, \mathrm{CH}_{3}, 3 \mathrm{H}\right) \cdot{ }^{1} \mathrm{H}\left\{{ }^{11} \mathrm{~B}\right\}$ NMR: $\delta=6.0\left(s, \mathrm{C}_{\mathrm{pyr}}-\mathrm{H}\right.$, $1 \mathrm{H}), 5.8\left(s, \mathrm{C}_{\mathrm{pyr}}-\mathrm{H}, 1 \mathrm{H}\right), 3.9\left(b r s, \mathrm{C}_{c}-\mathrm{H}, 1 \mathrm{H}\right), 3.1(b r s, \mathrm{~B}-\mathrm{H}, 4 \mathrm{H})$, $1.8($ br $s, \mathrm{~B}-\mathrm{H}, 5 \mathrm{H}), 2.4\left(s, \mathrm{C}_{\mathrm{pyr}}-\mathrm{CH}_{3}, 6 \mathrm{H}\right), 2.3\left(s, \mathrm{CH}_{3}, 3 \mathrm{H}\right) .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR: $\delta=124.7\left(s, \mathrm{~N}-\mathrm{C}_{\mathrm{pyr}}\right), 124.2\left(s, \mathrm{~N}-\mathrm{C}_{\mathrm{pyr}}\right), 89.6\left(s, \mathrm{C}_{\mathrm{pyr}}-\mathrm{C}_{\mathrm{pyr}}\right)$, $87.6\left(s, \mathrm{C}_{\mathrm{pyr}}-\mathrm{C}_{\mathrm{pyr}}\right), 74.9\left(s, \mathrm{C}_{c}-\mathrm{CH}_{3}\right), 60.8\left(s, \mathrm{C}_{c}-\mathrm{H}\right), 31.6\left(s, \mathrm{C}_{c}-\right.$ $\left.\mathrm{CH}_{3}\right), 13.6\left(\mathrm{C}_{\mathrm{pyr}}-\mathrm{CH}_{3}\right) .{ }^{11} \mathrm{~B}$ NMR: $\delta=6.2\left(d,{ }^{1} J_{\mathrm{B}, \mathrm{H}}=149,1 \mathrm{~B}\right), 3.6(d$, $\left.{ }^{1} J_{\mathrm{B}, \mathrm{H}}=147,1 \mathrm{~B}\right), 0.2\left(d,{ }^{1} J_{\mathrm{B}, \mathrm{H}}=153,1 \mathrm{~B}\right),-3.8\left(d,{ }^{1} J_{\mathrm{B}, \mathrm{H}}=138,2 \mathrm{~B}\right),-4.3$ $\left(d,{ }^{1} J_{\mathrm{B}, \mathrm{H}}=161,1 \mathrm{~B}\right),-7.1\left(d,{ }^{1} J_{\mathrm{B}, \mathrm{H}}=148,1 \mathrm{~B}\right),-11.8\left(d,{ }^{1} J_{\mathrm{B}, \mathrm{H}}=160\right.$, 1B), $-15.9\left(d,{ }^{1} J_{\mathrm{B}, \mathrm{H}}=159,1 \mathrm{~B}\right)$. Analysis calculated for $\mathrm{C}_{9} \mathrm{H}_{21} \mathrm{~B}_{9} \mathrm{CoN}$ : C 36.09, H 7.07, N 4.68\%; found: C 36.20, H 7.00, N 4.85\%.

3 standard reflections every 150 reflections intensity decay: $0.8 \%$

H atoms on the C atoms were treated as riding, with $\mathrm{C}-\mathrm{H}$ distances in the range $0.93-0.96 \AA$. H atoms on B atoms were refined with fixed isotropic displacement parameters, giving $\mathrm{B}-\mathrm{H}$ distances in the range 1.04 (3)-1.12 (3) $\AA$.
