In the structure of the title compound,  $[\text{Cu}^{\text{II}}(\text{en})_2][(\text{EtO})_2\text{P}(\text{S})\text{S}]_2$  (en is ethylenediamine) or  $[\text{Cu}(\text{C}_2\text{H}_8\text{N}_2)_2](\text{C}_4\text{H}_{10}\text{O}_2\text{PS}_2)_2$ , the Cu atom lies on a center of inversion and is coordinated in a slightly distorted square coordination geometry by four N atoms from two ethylenediamine molecules. The diethyl dithiophosphate moieties,  $(\text{EtO})_2\text{P}(\text{S})\text{S}^-$ , act as counter-anions.

### Comment

Compounds of bivalent copper exhibit different coordination arrangements, some being apparently four-coordinate, whereas others are generally five- and occasionally six-coordinate. The ligand-field strength of the donors is an important factor; weaker ligands may lead to an increased coordination number (Baker *et al.*, 1970). Usually, the donor capacity of the ligands decreases in the following order  $\text{en} > \text{phen} > \text{dmp}$ , where en is ethylenediamine, phen is phenanthroline and dmp is 2,9-dimethyl-1,10-phenanthroline (Kudrev, 1994).

Dialkyl dithiophosphates have extensive applications, such as antioxidants and antiwear additives in the rubber industry and in lubrication engineering (Kovtun *et al.*, 1992; Harrison & Kikabhai, 1987), as well as flotation agents for mineral ores and solvent extraction reagents for metals (Haiduc *et al.*, 1995; Rickelton & Boyle, 1990).

The reactions of copper(II) with the  $(\text{RO})_2\text{P}(\text{S})\text{S}^-$  ion and nitrogen-base ligands have been investigated (Lawton *et al.*, 1972; Yordanov *et al.*, 1993; Drew *et al.*, 1987). These copper(II) complexes can cause DNA damage in the presence

<sup>†</sup> Permanent address: Department of Chemistry, Faculty of Science, Prince of Songkla University, Hat-Yai, Songkhla 90112, Thailand.

of  $\text{H}_2\text{O}_2$ . It was reported that  $\text{Cu}^{\text{II}}(\text{en})_2$  and hydrogen peroxide at physiological conditions could cause the DNA strand to break (Ozawa *et al.*, 1993). Additionally,  $\text{Cu}^{\text{II}}(\text{en})_2$  complexes may be used as good catalysts for all oxidizers, and the catalytic activities for all oxidizers decreased in the order  $\text{Cu} > \text{Ni} > \text{Cd} \gg \text{Zn}$  (Sinditskii *et al.*, 1994).

In order to investigate the properties of the  $(\text{EtO})_2\text{P}(\text{S})\text{S}^-$  ion complexed with  $\text{Cu}^{\text{II}}(\text{en})_2$ , the title complex, (I), was synthesized and an X-ray structure analysis undertaken.

The asymmetric unit of (I) (Fig. 1) consists of one half of the complex molecule, and the unit cell contains two complexes. One half of the complex is related to the other by an inversion center at the Cu atom. The Cu atom is coordinated by four N atoms in a slightly distorted square coordination geometry. The Cu–N bond lengths are 2.016 (2) and 2.019 (2) Å, and the N–Cu–N bond angles are 84.6 (1) and 95.3 (1)°. The Cu–N values are normal for primary amines (Allen *et al.*, 1987). The bond lengths and angles of the title complex (Table 1) are comparable with those in a previous report of the same complex (Pervukhina & Podbereskaya, 1985), but the structure was solved in the wrong space group,  $P2_1$ . However, intensity statistics, as well as systematic extinctions, clearly indicate the space group to be  $P2_1/c$ . The Cu–N bond lengths are in good agreement with those observed in  $\text{Cu}(\text{en})\text{[N}(\text{NO}_2)\text{CH}_3]_2$  [Cu–N = 2.019 (3) Å; Palopoli *et al.*, 1988], while the N–Cu–N angles are slightly outside the bite-angle range for ethylenediamine in  $\text{Cu}^{\text{II}}$  complexes, typically 85–86° (Palopoli *et al.*, 1988).

The  $\text{Cu}^{\text{II}}$ –ethylenediamine complex molecule is not planar and adopts a twisted conformation. Atoms N1, N4, C2 and C3 deviate by 0.160 (2), –0.126 (2), –0.286 (3) and 0.267 (4) Å, respectively, from the mean plane of the  $\text{Cu}^{\text{II}}$ –ethylenediamine moiety, while the dihedral angle between the Cu1/N1/C2 and Cu1/N4/C3 planes is 19.5 (2)°.

In the  $(\text{EtO})_2\text{P}(\text{S})\text{S}^-$  anion, the P atom is coordinated tetrahedrally by two S atoms and two O atoms. The bond

Figure 1

The structure of the title complex showing 50% probability displacement ellipsoids and the atom-numbering scheme.

lengths around the P atom correspond to a P=S double bond and the P—O bond of an alkoxy O atom. The angles around the P atom are in the range 102.84 (11)–119.03 (5)°, implying a distorted tetrahedral coordination geometry for the P atom. The two ethoxy groups attached to the P atoms are nearly planar and make a dihedral angle of 86.3 (2)°.

The crystal structure of the title complex is built from alternating molecular layers of Cu<sup>II</sup>-ethylenediamine and (EtO)<sub>2</sub>P(S)S<sup>-</sup> stacked along the *c* axis. Atoms S1 and S2 are involved in intermolecular interactions with the amine (Table 2). These interactions link the molecular layers into a three-dimensional arrangement.

## Experimental

The preparation of the title complex was divided into two steps. First, Cu[(EtO)<sub>2</sub>PS<sub>2</sub>]<sub>2</sub> was prepared, following the method of Drew *et al.* (1987), as a brown solid and 5 mmol was dissolved in ethanol (20 ml). Secondly, for the preparation of [Cu<sup>II</sup>(en)][(EtO)<sub>2</sub>P(S)S]<sub>2</sub>, en (10 mmol) was added with stirring to an ethanol solution of Cu[(EtO)<sub>2</sub>PS<sub>2</sub>]<sub>2</sub>. A deep-blue solution formed immediately. As the EtOH evaporated slowly, purple single crystals of [Cu<sup>II</sup>(en)<sub>2</sub>]-[(EtO)<sub>2</sub>P(S)S]<sub>2</sub> suitable for X-ray analysis were obtained.

### Crystal data

[Cu(C <sub>2</sub> H <sub>5</sub> N <sub>2</sub> ) <sub>2</sub> ](C <sub>4</sub> H <sub>10</sub> O <sub>2</sub> PS <sub>2</sub> ) <sub>2</sub>	<i>D<sub>x</sub></i> = 1.426 Mg m <sup>-3</sup>
<i>M<sub>r</sub></i> = 554.22	Mo <i>K</i> α radiation
Monoclinic, <i>P</i> 2 <sub>1</sub> / <i>c</i>	Cell parameters from 5321 reflections
<i>a</i> = 14.6683 (3) Å	<i>θ</i> = 1.5–28.3°
<i>b</i> = 6.9409 (1) Å	<i>μ</i> = 1.32 mm <sup>-1</sup>
<i>c</i> = 13.5889 (1) Å	<i>T</i> = 293 (2) K
<i>β</i> = 111.157 (1)°	Slab, purple
<i>V</i> = 1290.25 (3) Å <sup>3</sup>	0.36 × 0.14 × 0.12 mm
<i>Z</i> = 2	

### Data collection

Siemens SMART CCD area-detector diffractometer	3144 independent reflections
<i>ω</i> scans	2125 reflections with <i>I</i> > 2σ( <i>I</i> )
Absorption correction: empirical (SADABS; Sheldrick, 1996)	<i>R</i> <sub>int</sub> = 0.089
<i>T</i> <sub>min</sub> = 0.649, <i>T</i> <sub>max</sub> = 0.858	<i>θ</i> <sub>max</sub> = 28.3°
8941 measured reflections	<i>h</i> = -19 → 11
	<i>k</i> = -9 → 9
	<i>l</i> = -15 → 18

### Refinement

Refinement on <i>F</i> <sup>2</sup>	H-atom parameters constrained
<i>R</i> [ <i>F</i> <sup>2</sup> > 2σ( <i>F</i> <sup>2</sup> )] = 0.045	<i>w</i> = 1/[σ <sup>2</sup> ( <i>F<sub>o</sub></i> <sup>2</sup> ) + (0.0254 <i>P</i> ) <sup>2</sup> ]
<i>wR</i> ( <i>F</i> <sup>2</sup> ) = 0.106	where <i>P</i> = ( <i>F<sub>o</sub></i> <sup>2</sup> + 2 <i>F<sub>c</sub></i> <sup>2</sup> )/3
<i>S</i> = 0.92	(Δ/σ) <sub>max</sub> < 0.001
3144 reflections	Δρ <sub>max</sub> = 0.55 e Å <sup>-3</sup>
126 parameters	Δρ <sub>min</sub> = -1.14 e Å <sup>-3</sup>

After checking their presence in the difference map, all H atoms were fixed geometrically and allowed to ride on their parent C and N atoms in the refinement.

Data collection: SMART (Siemens, 1996); cell refinement: SAINT (Siemens, 1996); data reduction: SAINT; program(s) used to solve structure: SHELXTL (Sheldrick, 1997); program(s) used to refine structure: SHELXTL; molecular graphics: SHELXTL; software used to prepare material for publication: SHELXTL, PARST (Nardelli, 1995) and PLATON (Spek, 1990).

The authors would like to thank the Malaysian Government and Universiti Sains Malaysia for research grant R&D No.
