The title compound, $\left[\mathrm{Cu}\left(\mathrm{Cr}_{2} \mathrm{O}_{7}\right)\left(\mathrm{C}_{10} \mathrm{H}_{8} \mathrm{~N}_{2}\right)_{2}\right]$, a new mixedmetal molecular compound, contains isolated molecular units, each comprised of one $\mathrm{Cu}^{\text {II }}$ atom coordinated to two $2,2^{\prime}$ bipyridine ligands and also to an oxygen vertex of a dichromate anion. The $\mathrm{Cu}^{\mathrm{II}}$ atom has an approximate trigonal-bipyramidal geometry, which is consistent with previous studies. Both enantiomers of the chiral complex molecule are present and are related by inversion centers. In a reported pyridine analogue, achiral $\left.\left[\mathrm{Cu}\left(\mathrm{Cr}_{2} \mathrm{O}_{7}\right) \text { (pyridine }\right)_{4}\right]$ chains pack in the non-centrosymmetric space group $P n a 2_{1}$. Differences in the organic ligands influence the chirality and dimensionality of the $\mathrm{Cu}-\mathrm{Cr}_{2} \mathrm{O}_{7}$ bonding.

## Comment

Non-centrosymmetric molecular units, such as those with tetrahedral or distorted octahedral geometries, have been cited for their roles in the synthesis of non-centrosymmetric (NCS) solids (Halasyamani \& Poeppelmeier, 1998). Recently, $\left[\mathrm{Cu}\left(\mathrm{Cr}_{2} \mathrm{O}_{7}\right)(\text { pyridine })_{4}\right]$ (Norquist et al., 2001) was reported in an NCS space group, with chains comprising alternating octahedral $\mathrm{CuN}_{4} \mathrm{O}_{2}$ and tetrahedral $\mathrm{Cr}_{2} \mathrm{O}_{7}$ polyhedra, which are connected through shared oxygen vertices. The chains are reported to exhibit similarities to the helical $\mathrm{TiO}_{4 / 2} \mathrm{O}_{2 / 2}$ chain ( $4 / 2$ refers to four oxygen vertices each shared between two titanium polyhedra) found in non-centrosymmetric $\mathrm{KTiOPO}_{4}$ (Tordjman et al., 1974). In separate research, prior physicochemical and reactivity studies of the title compound, (I), have focused on the importance of weak $\mathrm{Cr}_{2} \mathrm{O}_{7}$ coordination to Cu for either selective oxidation or mutagenic activity (CieslakGolonka et al., 1991; Szyba et al., 1992). In light of the above interests, a complete crystallographic study of ( $2,2^{\prime}$-bipyridine)(dichromato)copper(II), (I), seemed justified.

Crystals of (I) were hydrothermally synthesized from Cu and Cr oxides and $2,2^{\prime}$-bipyridine inside an autoclave. A view of the resulting mixed-metal $(\mathrm{Cu} / \mathrm{Cr})$ molecule is shown in Fig. 1. The inversion symmetry occurs between separate left-
and right-handed molecules of (I). The crystal structures of (I) and $\left[\mathrm{Cu}\left(\mathrm{Cr}_{2} \mathrm{O}_{7}\right)(\text { pyridine })_{4}\right]$ (Norquist et al., 2001) exhibit similar $\mathrm{Cr}-\mathrm{O}$ and $\mathrm{Cu}-\mathrm{N}$ bond lengths. The shared oxygen vertex ( O 4 ) between the chromium centers is approximately $0.12 \AA$ further from the chromium centers than are the unshared oxygen vertices, as in $\left.\left[\mathrm{Cu}\left(\mathrm{Cr}_{2} \mathrm{O}_{7}\right) \text { (pyridine) }\right)_{4}\right]$. The dihydrate of (I) also exhibits similar molecular units spaced by water molecules (Ii et al., 1996).

(I)

Two dramatic differences between the non-centrosymmetric structure of $\left.\left[\mathrm{Cu}\left(\mathrm{Cr}_{2} \mathrm{O}_{7}\right) \text { (pyridine) }\right)_{4}\right]$ and (I) are caused by the ligand change. The first is that in (I), the copper coordination is approximately trigonal bipyramidal $\left(\mathrm{CuON}_{4}\right)$, as in the dihydrate (Ii et al., 1996), while in $\left[\mathrm{Cu}\left(\mathrm{Cr}_{2} \mathrm{O}_{7}\right)(\text { pyridine })_{4}\right]$, it is octahedral $\left(\mathrm{CuN}_{4} \mathrm{O}_{2}\right)$. The distortion of the Cu atom from regular octahedral geometry has been associated with the predicted $d_{z^{2}}$ ground state of (I) from electron-spin resonance (ESR) data (Cieslak-Golonka et al., 1991). Both a trigonal bipyramidal and octahedral copper coordination is consistent with a +2 oxidation state, which balances the $2-$ charge on the $\left[\mathrm{Cr}_{2} \mathrm{O}_{7}\right]^{2-}$ anion. Structurally, the approximate bipyramidal coordination in (I) occurs because a second $\mathrm{Cr}_{2} \mathrm{O}_{7}$ group does not bind (trans) to copper, likely related to the greater steric

effects of $2,2^{\prime}$-dipyridine compared with pyridine. The second difference is that (I) contains isolated molecular units rather than the infinite chains seen in the pyridine analogue. Again, this is a result of the monodentate coordination of $\mathrm{Cr}_{2} \mathrm{O}_{7}$, which eliminates extended $\mathrm{Cu}-\mathrm{O}-\mathrm{Cr}-\mathrm{O}-\mathrm{Cr}-\mathrm{O}-\mathrm{Cu}$ bonding. The next closest $\mathrm{Cu}-\mathrm{Cr}_{2} \mathrm{O}_{7}$ contact between neighboring molecules in (I) is 3.250 (3) $\AA$ (drawn with a dotted line in Fig. 2), much longer than the shorter $\mathrm{Cu}-\mathrm{Cr}_{2} \mathrm{O}_{7}$ distance of 2.116 (2) A. Similar arguments also apply to the dihydrate structure of (I) (Ii et al., 1996), where internal water molecules probably do not influence the $\mathrm{Cu}-\mathrm{Cr}_{2} \mathrm{O}_{7}$ bonding.

Non-coordinated O atoms at the end of the dichromate anion (O5, O6 and O7) have more lone pairs of electrons available and are compensated by additional short $\mathrm{O} \cdots \mathrm{H}$ distances to the $2,2^{\prime}$-bipyridine ligand. Both O 2 and O 4 are coordinated to two cations, one Cu and one Cr , and each has only one short distance to hydrogen $(2.4-2.5 \AA)$. The remaining O atoms ( O 1 and O 3 on the coordinated $\mathrm{CrO}_{4}$ tetrahedron) also have few short $\mathrm{O} \cdots \mathrm{H}$ contacts; $\mathrm{H} \cdots \mathrm{O} 12.66$ and $2.59 \AA$, and $\mathrm{H} \cdots \mathrm{O} 32.62 \AA$. The non-coordinated $\mathrm{CrO}_{4}$ tetrahedron has relatively more O $\cdots$ H contacts: O5 2.41, 2.43 and $2.55 \AA$; O6 2.48, 2.52 and $2.60 \AA$; O7 2.36, 2.50, 2.67, 2.76 and $2.81 \AA$.

The crystal packing of one layer of molecules of (I) is shown in Fig. 2. In contrast to the non-centrosymmetric structure of $\left.\left[\mathrm{Cu}\left(\mathrm{Cr}_{2} \mathrm{O}_{7}\right) \text { (pyridine }\right)_{4}\right]$, which contains infinite chains, the full crystal packing of (I) contains an inversion center between the successive layers. When considering if a solid will crystallize in a centrosymmetric or non-centrosymmetric space group, it is required that a solid is restricted to non-centrosymmetric space groups when a single enantiomer of a chiral unit, such as a helix, is present. However, the chiral title molecules are racemically mixed, and the three-dimensional structure is noncentrosymmetric. In contrast, the individual $\mathrm{Cu}-\mathrm{Cr}_{2} \mathrm{O}_{7}$ chains in $\left.\left[\mathrm{Cu}\left(\mathrm{Cr}_{2} \mathrm{O}_{7}\right) \text { (pyridine }\right)_{4}\right]$ are achiral, so that enantiomer formation does not influence its (non)centricity.

## Experimental

The title compound was synthesized by placing $\mathrm{CuO}(89.4 \mathrm{mg})$, $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}(157.5 \mathrm{mg})$ and 2,2'-bipyridine $(195.2 \mathrm{mg})$ in a Teflon pouch (Harrison et al., 1993). To the pouch were added $\mathrm{NH}_{4} \mathrm{HF}_{2}$ $(178.2 \mathrm{mg})$ and deionized $\mathrm{H}_{2} \mathrm{O}(1125 \mathrm{mg})$. The pouch was heat-sealed and placed in a 125 ml autoclave, which was back-filled with $\mathrm{H}_{2} \mathrm{O}$ $(45 \mathrm{ml})$. The autoclave was heated inside an oven for 24 h at 423 K and cooled to room temperature at a rate of $6 \mathrm{~K} \mathrm{~h}^{-1}$. The pouch was opened in air and (I) was recovered in $85 \%$ yield based on CuO by filtration.
